Sage Exercises for Abstract Algebra

Robert A. Beezer
University of Puget Sound

November 14, 2018

Thomas W. Judson did his undergraduate work in Illinois, his graduate work in Oregon and presently teaches in Texas.

He likes to ride his bicycle in France, especially in the high Alps and Pyrenees on the roads of the Tour de France.

About Robert A. Beezer Rob Beezer designed, wrote, and tested the Sage exercises as a contribution to this open source project.

He also likes to ride his bicycle, and once rode with Tom Judson in the high Alps, in addition to some hiking there, up above the passes the cyclists ride.

I would also like to thank Steve Quigley, Marnie Pommert, Cathie Griffin, Kelle Karshick, and the rest of the staff at PWS Publishing for their guidance throughout this project. It has been a pleasure to work with them.

Robert Beezer encouraged me to make *Abstract Algebra: Theory and Applications* available as an open source textbook, a decision that I have never regretted. With his assistance, the book has been rewritten in MathBook XML (<http://mathbook.pugetsound.edu>), making it possible to quickly output print, web, PDF versions and more from the same source. The open source version of this book has received support from the National Science Foundation (Award #DUE-1020957).

Preface

This text is intended for a one or two-semester undergraduate course in abstract algebra. Traditionally, these courses have covered the theoretical aspects of groups, rings, and fields. However, with the development of computing in the last several decades, applications that involve abstract algebra and discrete mathematics have become increasingly important, and many science, engineering, and computer science students are now electing to minor in mathematics. Though theory still occupies a central role in the subject of abstract algebra and no student should go through such a course without a good notion of what a proof is, the importance of applications such as coding theory and cryptography has grown significantly.

Until recently most abstract algebra texts included few if any applications. However, one of the major problems in teaching an abstract algebra course is that for many students it is their first encounter with an environment that requires them to do rigorous proofs. Such students often find it hard to see the use of learning to prove theorems and propositions; applied examples help the instructor provide motivation.

This text contains more material than can possibly be covered in a single semester. Certainly there is adequate material for a two-semester course, and perhaps more; however, for a one-semester course it would be quite easy to omit selected chapters and still have a useful text. The order of presentation of topics is standard: groups, then rings, and finally fields. Emphasis can be placed either on theory or on applications. A typical one-semester course might cover groups and rings while briefly touching on field theory, using Chapters 1 through 6, 9, 10, 11, 13 (the first part), 16, 17, 18 (the first part), 20, and 21. Parts of these chapters could be deleted and applications substituted according to the interests of the students and the instructor. A two-semester course emphasizing theory might cover Chapters 1 through 6, 9, 10, 11, 13 through 18, 20, 21, 22 (the first part), and 23. On the other hand, if applications are to be emphasized, the course might cover Chapters 1 through 14, and 16 through 22. In an applied course, some of the more theoretical results could be assumed or omitted. A chapter dependency chart appears below. (A broken line indicates a partial dependency.) See the [Table of Contents](#) for more.

This real text has been used as the basis of a sample book for testing Pre-TeXt. So it is slowly migrating away from what the real book looks like and should not be construed as representative. For example, we have reduced the book to four chapters, broken into two parts, (((Unresolved xref, reference "part-basics"; check spelling or use "provisional" attribute))) and (((Unresolved xref, reference "part-algebra"; check spelling or use "provisional" attribute))). Indeed, that previous sentence was more an excuse to test some cross-references with parts in the structural case, such as this one to DeMoivre's Theorem, [Theorem 4.3.7](#).

Though there are no specific prerequisites for a course in abstract algebra, students who have had other higher-level courses in mathematics will generally be more prepared than those who have not, because they will possess a bit more mathematical sophistication. Occasionally, we shall assume some basic linear algebra; that is, we shall take for granted an elementary knowledge of matrices and determinants. This should present no great problem, since most students taking a course in abstract algebra have been introduced to matrices and determinants elsewhere in their career, if they have not already taken a sophomore or junior-level course in linear algebra.

Exercise sections are the heart of any mathematics text. An exercise set appears at the end of each chapter. The nature of the exercises ranges over several categories; computational, conceptual, and theoretical problems are included. A section presenting hints and solutions to many of the exercises appears at the end of the text. Often in the solutions a proof is only sketched, and it is up to the student to provide the details. The exercises range in difficulty from very easy to very challenging. Many of the more substantial problems require careful thought, so the student should not be discouraged if the solution is not forthcoming after a few minutes of work.

There are additional exercises or computer projects at the ends of many of the chapters. The computer projects usually require a knowledge of programming. All of these exercises and projects are more substantial in nature and allow the exploration of new results and theory.

Sage ([sagemath.org](https://www.sagemath.org)) is a free, open source, software system for advanced mathematics, which is ideal for assisting with a study of abstract algebra. Sage can be used either on your own computer, a local server, or on SageMathCloud (<https://cloud.sagemath.com>). Robert Beezer has written a comprehensive

introduction to Sage and a selection of relevant exercises that appear at the end of each chapter, including live Sage cells in the web version of the book.

Chapter 1

Preliminaries

A certain amount of mathematical maturity is necessary to find and study applications of abstract algebra. A basic knowledge of set theory, mathematical induction, equivalence relations, and matrices is a must. Even more important is the ability to read and understand mathematical proofs. In this chapter we will outline the background needed for a course in abstract algebra.

1.1 A Short Note on Proofs

Abstract mathematics is different from other sciences. In laboratory sciences such as chemistry and physics, scientists perform experiments to discover new principles and verify theories. Although mathematics is often motivated by physical experimentation or by computer simulations, it is made rigorous through the use of logical arguments. In studying abstract mathematics, we take what is called an axiomatic approach; that is, we take a collection of objects \mathcal{S} and assume some rules about their structure. These rules are called **axioms**. Using the axioms for \mathcal{S} , we wish to derive other information about \mathcal{S} by using logical arguments. We require that our axioms be consistent; that is, they should not contradict one another. We also demand that there not be too many axioms. If a system of axioms is too restrictive, there will be few examples of the mathematical structure.

A **statement** in logic or mathematics is an assertion that is either true or false. Consider the following examples:

- $3 + 56 - 13 + 8/2$.
- All cats are black.
- $2 + 3 = 5$.
- $2x = 6$ exactly when $x = 4$.
- If $ax^2 + bx + c = 0$ and $a \neq 0$, then

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

- $x^3 - 4x^2 + 5x - 6$.

All but the first and last examples are statements, and must be either true or false.

A **mathematical proof** is nothing more than a convincing argument about the accuracy of a statement. Such an argument should contain enough detail to convince the audience; for instance, we can see that the statement “ $2x = 6$ exactly when $x = 4$ ” is false by evaluating $2 \cdot 4$ and noting that $6 \neq 8$, an argument that would satisfy anyone. Of course, audiences may vary widely: proofs can be addressed to another student, to a professor, or to the reader of a text. If more detail than needed is presented in the proof, then the explanation will be either long-winded or poorly written. If too much detail is omitted, then the proof may not be convincing. Again it is important to keep the audience in mind. High school students require much more detail than do graduate students. A good rule of thumb for an argument in an introductory abstract algebra course is that it should be written to convince one’s peers, whether those peers be other students or other readers of the text.

Let us examine different types of statements. A statement could be as simple as “ $10/5 = 2$,” however, mathematicians are usually interested in more complex statements such as “If p , then q ,” where p and q are both statements. If certain statements are known or assumed to be true, we wish to know what we can say about other statements. Here p is called the **hypothesis** and q is known as the **conclusion**. Consider the following statement: If $ax^2 + bx + c = 0$ and $a \neq 0$, then

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

The hypothesis is $ax^2 + bx + c = 0$ and $a \neq 0$; the conclusion is

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

Notice that the statement says nothing about whether or not the hypothesis is true. However, if this entire statement is true and we can show that $ax^2 + bx + c = 0$ with $a \neq 0$ is true, then the conclusion *must* be true. A proof of this statement might simply be a series of equations:

$$\begin{aligned} ax^2 + bx + c &= 0 \\ x^2 + \frac{b}{a}x &= -\frac{c}{a} \\ x^2 + \frac{b}{a}x + \left(\frac{b}{2a}\right)^2 &= \left(\frac{b}{2a}\right)^2 - \frac{c}{a} \\ \left(x + \frac{b}{2a}\right)^2 &= \frac{b^2 - 4ac}{4a^2} \\ x + \frac{b}{2a} &= \frac{\pm\sqrt{b^2 - 4ac}}{2a} \\ x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}. \end{aligned}$$

If we can prove a statement true, then that statement is called a **proposition**. A proposition of major importance is called a **theorem**. Sometimes instead of proving a theorem or proposition all at once, we break the proof down into modules; that is, we prove several supporting propositions, which are called **lemmas**, and use the results of these propositions to prove the main result. If we can prove a proposition or a theorem, we will often, with very little effort, be able to derive other related propositions called **corollaries**.

1.1.1 Some Cautions and Suggestions

There are several different strategies for proving propositions. In addition to using different methods of proof, students often make some common mistakes when they are first learning how to prove theorems. To aid students who are studying abstract mathematics for the first time, we list here some of the difficulties that they may encounter and some of the strategies of proof available to them. It is a good idea to keep referring back to this list as a reminder. (Other techniques of proof will become apparent throughout this chapter and the remainder of the text.)

- A theorem cannot be proved by example; however, the standard way to show that a statement is not a theorem is to provide a counterexample.
- Quantifiers are important. Words and phrases such as *only*, *for all*, *for every*, and *for some* possess different meanings.
- Never assume any hypothesis that is not explicitly stated in the theorem. *You cannot take things for granted.*
- Suppose you wish to show that an object *exists* and is *unique*. First show that there actually is such an object. To show that it is unique, assume that there are two such objects, say r and s , and then show that $r = s$.
- Sometimes it is easier to prove the contrapositive of a statement. Proving the statement “If p , then q ” is exactly the same as proving the statement “If not q , then not p .”
- Although it is usually better to find a direct proof of a theorem, this task can sometimes be difficult. It may be easier to assume that the theorem that you are trying to prove is false, and to hope that in the course of your argument you are forced to make some statement that cannot possibly be true.

Remember that one of the main objectives of higher mathematics is proving theorems. Theorems are tools that make new and productive applications of mathematics possible. We use examples to give insight into existing theorems and to foster intuitions as to what new theorems might be true. Applications, examples, and proofs are tightly interconnected—much more so than they may seem at first appearance.

1.2 Sets and Equivalence Relations

1.2.1 Set Theory

A **set** is a well-defined collection of objects; that is, it is defined in such a manner that we can determine for any given object x whether or not x belongs to the set. The objects that belong to a set are called its **elements** or **members**. We will denote sets by capital letters, such as A or X ; if a is an element of the set A , we write $a \in A$.

A set is usually specified either by listing all of its elements inside a pair of braces or by stating the property that determines whether or not an object x belongs to the set. We might write

$$X = \{x_1, x_2, \dots, x_n\}$$

for a set containing elements x_1, x_2, \dots, x_n or

$$X = \{x : x \text{ satisfies } \mathcal{P}\}$$

if each x in X satisfies a certain property \mathcal{P} . For example, if E is the set of even positive integers, we can describe E by writing either

$$E = \{2, 4, 6, \dots\} \quad \text{or} \quad E = \{x : x \text{ is an even integer and } x > 0\}.$$

We write $2 \in E$ when we want to say that 2 is in the set E , and $-3 \notin E$ to say that -3 is not in the set E .

Some of the more important sets that we will consider are the following:

$$\mathbb{N} = \{n : n \text{ is a natural number}\} = \{1, 2, 3, \dots\};$$

$$\mathbb{Z} = \{n : n \text{ is an integer}\} = \{\dots, -1, 0, 1, 2, \dots\};$$

$$\mathbb{Q} = \{r : r \text{ is a rational number}\} = \{p/q : p, q \in \mathbb{Z} \text{ where } q \neq 0\};$$

$$\mathbb{R} = \{x : x \text{ is a real number}\};$$

$$\mathbb{C} = \{z : z \text{ is a complex number}\}.$$

We can find various relations between sets as well as perform operations on sets. A set A is a **subset** of B , written $A \subset B$ or $B \supset A$, if every element of A is also an element of B . For example,

$$\{4, 5, 8\} \subset \{2, 3, 4, 5, 6, 7, 8, 9\}$$

and

$$\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R} \subset \mathbb{C}.$$

Trivially, every set is a subset of itself. A set B is a **proper subset** of a set A if $B \subset A$ but $B \neq A$. If A is not a subset of B , we write $A \not\subset B$; for example, $\{4, 7, 9\} \not\subset \{2, 4, 5, 8, 9\}$. Two sets are **equal**, written $A = B$, if we can show that $A \subset B$ and $B \subset A$.

It is convenient to have a set with no elements in it. This set is called the **empty set** and is denoted by \emptyset . Note that the empty set is a subset of every set.

To construct new sets out of old sets, we can perform certain operations: the **union** $A \cup B$ of two sets A and B is defined as

$$A \cup B = \{x : x \in A \text{ or } x \in B\};$$

the **intersection** of A and B is defined by

$$A \cap B = \{x : x \in A \text{ and } x \in B\}.$$

If $A = \{1, 3, 5\}$ and $B = \{1, 2, 3, 9\}$, then

$$A \cup B = \{1, 2, 3, 5, 9\} \quad \text{and} \quad A \cap B = \{1, 3\}.$$

We can consider the union and the intersection of more than two sets. In this case we write

$$\bigcup_{i=1}^n A_i = A_1 \cup \dots \cup A_n$$

and

$$\bigcap_{i=1}^n A_i = A_1 \cap \dots \cap A_n$$

for the union and intersection, respectively, of the sets A_1, \dots, A_n .

When two sets have no elements in common, they are said to be **disjoint**; for example, if E is the set of even integers and O is the set of odd integers, then E and O are disjoint. Two sets A and B are disjoint exactly when $A \cap B = \emptyset$.

Sometimes we will work within one fixed set U , called the **universal set**. For any set $A \subset U$, we define the **complement** of A , denoted by A' , to be the set

$$A' = \{x : x \in U \text{ and } x \notin A\}.$$

We define the **difference** of two sets A and B to be

$$A \setminus B = A \cap B' = \{x : x \in A \text{ and } x \notin B\}.$$

Example 1.2.1 Set Operations. Let \mathbb{R} be the universal set and suppose that

$$A = \{x \in \mathbb{R} : 0 < x \leq 3\} \quad \text{and} \quad B = \{x \in \mathbb{R} : 2 \leq x < 4\}.$$

Then

$$\begin{aligned} A \cap B &= \{x \in \mathbb{R} : 2 \leq x \leq 3\} \\ A \cup B &= \{x \in \mathbb{R} : 0 < x < 4\} \\ A \setminus B &= \{x \in \mathbb{R} : 0 < x < 2\} \\ A' &= \{x \in \mathbb{R} : x \leq 0 \text{ or } x > 3\}. \end{aligned}$$

□

Proposition 1.2.2 *Let A , B , and C be sets. Then*

1. $A \cup A = A$, $A \cap A = A$, and $A \setminus A = \emptyset$;
2. $A \cup \emptyset = A$ and $A \cap \emptyset = \emptyset$;
3. $A \cup (B \cup C) = (A \cup B) \cup C$ and $A \cap (B \cap C) = (A \cap B) \cap C$;
4. $A \cup B = B \cup A$ and $A \cap B = B \cap A$;
5. $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$;
6. $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$.

Proof. We will prove (1) and (3) and leave the remaining results to be proven in the exercises.

(1) Observe that

$$\begin{aligned} A \cup A &= \{x : x \in A \text{ or } x \in A\} \\ &= \{x : x \in A\} \\ &= A \end{aligned}$$

and

$$\begin{aligned} A \cap A &= \{x : x \in A \text{ and } x \in A\} \\ &= \{x : x \in A\} \\ &= A. \end{aligned}$$

Also, $A \setminus A = A \cap A' = \emptyset$.

(3) For sets A , B , and C ,

$$A \cup (B \cup C) = A \cup \{x : x \in B \text{ or } x \in C\}$$

$$\begin{aligned}
&= \{x : x \in A \text{ or } x \in B, \text{ or } x \in C\} \\
&= \{x : x \in A \text{ or } x \in B\} \cup C \\
&= (A \cup B) \cup C.
\end{aligned}$$

A similar argument proves that $A \cap (B \cap C) = (A \cap B) \cap C$. ■

Theorem 1.2.3 De Morgan's Laws. (Augustus De Morgan, 1806–1871) *Let A and B be sets. Then*

1. $(A \cup B)' = A' \cap B'$;
2. $(A \cap B)' = A' \cup B'$.

Proof. (1) We must show that $(A \cup B)' \subset A' \cap B'$ and $(A \cup B)' \supset A' \cap B'$. Let $x \in (A \cup B)'$. Then $x \notin A \cup B$. So x is neither in A nor in B , by the definition of the union of sets. By the definition of the complement, $x \in A'$ and $x \in B'$. Therefore, $x \in A' \cap B'$ and we have $(A \cup B)' \subset A' \cap B'$.

To show the reverse inclusion, suppose that $x \in A' \cap B'$. Then $x \in A'$ and $x \in B'$, and so $x \notin A$ and $x \notin B$. Thus $x \notin A \cup B$ and so $x \in (A \cup B)'$. Hence, $(A \cup B)' \supset A' \cap B'$ and so $(A \cup B)' = A' \cap B'$.

The proof of (2) is left as an exercise. ■

Example 1.2.4 Other Relations on Sets. Other relations between sets often hold true. For example,

$$(A \setminus B) \cap (B \setminus A) = \emptyset.$$

To see that this is true, observe that

$$\begin{aligned}
(A \setminus B) \cap (B \setminus A) &= (A \cap B') \cap (B \cap A') \\
&= A \cap A' \cap B \cap B' \\
&= \emptyset.
\end{aligned}$$

□

1.2.2 Cartesian Products and Mappings

Given sets A and B , we can define a new set $A \times B$, called the **Cartesian product** of A and B , as a set of ordered pairs. That is,

$$A \times B = \{(a, b) : a \in A \text{ and } b \in B\}.$$

Example 1.2.5 Cartesian Products. If $A = \{x, y\}$, $B = \{1, 2, 3\}$, and $C = \emptyset$, then $A \times B$ is the set

$$\{(x, 1), (x, 2), (x, 3), (y, 1), (y, 2), (y, 3)\}$$

and

$$A \times C = \emptyset.$$

□

We define the **Cartesian product of n sets** to be

$$A_1 \times \cdots \times A_n = \{(a_1, \dots, a_n) : a_i \in A_i \text{ for } i = 1, \dots, n\}.$$

If $A = A_1 = A_2 = \cdots = A_n$, we often write A^n for $A \times \cdots \times A$ (where A would be written n times). For example, the set \mathbb{R}^3 consists of all of 3-tuples of real numbers.

Subsets of $A \times B$ are called **relations**. We will define a **mapping** or **function** $f \subset A \times B$ from a set A to a set B to be the special type of relation where $(a, b) \in f$ if for every element $a \in A$ there exists a unique element $b \in B$. Another way of saying this is that for every element in A , f assigns a unique element in B . We usually write $f : A \rightarrow B$ or $A \xrightarrow{f} B$. Instead of writing down ordered pairs $(a, b) \in A \times B$, we write $f(a) = b$ or $f : a \mapsto b$. The set A is called the **domain** of f and

$$f(A) = \{f(a) : a \in A\} \subset B$$

is called the **range** or **image** of f . We can think of the elements in the function's domain as input values and the elements in the function's range as output values.

Figure 1.2.6: Mappings and relations

Example 1.2.7 Mappings. Suppose $A = \{1, 2, 3\}$ and $B = \{a, b, c\}$. In [Figure 1.2.6](#) we define relations f and g from A to B . The relation f is a mapping, but g is not because $1 \in A$ is not assigned to a unique element in B ; that is, $g(1) = a$ and $g(1) = b$. \square

Given a function $f : A \rightarrow B$, it is often possible to write a list describing what the function does to each specific element in the domain. However, not all functions can be described in this manner. For example, the function $f : \mathbb{R} \rightarrow \mathbb{R}$ that sends each real number to its cube is a mapping that must be described by writing $f(x) = x^3$ or $f : x \mapsto x^3$.

Consider the relation $f : \mathbb{Q} \rightarrow \mathbb{Z}$ given by $f(p/q) = p$. We know that $1/2 = 2/4$, but is $f(1/2) = 1$ or 2 ? This relation cannot be a mapping because it is not well-defined. A relation is **well-defined** if each element in the domain is assigned to a *unique* element in the range.

If $f : A \rightarrow B$ is a map and the image of f is B , i.e., $f(A) = B$, then f is said to be **onto** or **surjective**. In other words, if there exists an $a \in A$ for each $b \in B$ such that $f(a) = b$, then f is onto. A map is **one-to-one** or **injective** if $a_1 \neq a_2$ implies $f(a_1) \neq f(a_2)$. Equivalently, a function is one-to-one if

$f(a_1) = f(a_2)$ implies $a_1 = a_2$. A map that is both one-to-one and onto is called **bijective**.

Example 1.2.8 One-to-One and Onto Mappings. Let $f : \mathbb{Z} \rightarrow \mathbb{Q}$ be defined by $f(n) = n/1$. Then f is one-to-one but not onto. Define $g : \mathbb{Q} \rightarrow \mathbb{Z}$ by $g(p/q) = p$ where p/q is a rational number expressed in its lowest terms with a positive denominator. The function g is onto but not one-to-one. \square

Given two functions, we can construct a new function by using the range of the first function as the domain of the second function. Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be mappings. Define a new map, the **composition** of f and g from A to C , by $(g \circ f)(x) = g(f(x))$.

Figure 1.2.9: Composition of maps

Example 1.2.10 Composition of Mappings. Consider the functions $f : A \rightarrow B$ and $g : B \rightarrow C$ that are defined in Figure 1.2.9 (top). The composition of these functions, $g \circ f : A \rightarrow C$, is defined in Figure 1.2.9 (bottom). \square

Example 1.2.11 Composition is not Commutative. Let $f(x) = x^2$ and $g(x) = 2x + 5$. Then

$$(f \circ g)(x) = f(g(x)) = (2x + 5)^2 = 4x^2 + 20x + 25$$

and

$$(g \circ f)(x) = g(f(x)) = 2x^2 + 5.$$

In general, order makes a difference; that is, in most cases $f \circ g \neq g \circ f$. \square

Example 1.2.12 Some Mappings Commute. Sometimes it is the case that $f \circ g = g \circ f$. Let $f(x) = x^3$ and $g(x) = \sqrt[3]{x}$. Then

$$(f \circ g)(x) = f(g(x)) = f(\sqrt[3]{x}) = (\sqrt[3]{x})^3 = x$$

and

$$(g \circ f)(x) = g(f(x)) = g(x^3) = \sqrt[3]{x^3} = x.$$

\square

Example 1.2.13 A Linear Map. Given a 2×2 matrix

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix},$$

we can define a map $T_A : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ by

$$T_A(x, y) = (ax + by, cx + dy)$$

for (x, y) in \mathbb{R}^2 . This is actually matrix multiplication; that is,

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} ax + by \\ cx + dy \end{pmatrix}.$$

Maps from \mathbb{R}^n to \mathbb{R}^m given by matrices are called **linear maps** or **linear transformations**. \square

Example 1.2.14 A Permutation. Suppose that $S = \{1, 2, 3\}$. Define a map $\pi : S \rightarrow S$ by

$$\pi(1) = 2, \quad \pi(2) = 1, \quad \pi(3) = 3.$$

This is a bijective map. An alternative way to write π is

$$\begin{pmatrix} 1 & 2 & 3 \\ \pi(1) & \pi(2) & \pi(3) \end{pmatrix} = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 1 & 3 \end{pmatrix}.$$

For any set S , a one-to-one and onto mapping $\pi : S \rightarrow S$ is called a **permutation** of S . \square

Theorem 1.2.15 *Let $f : A \rightarrow B$, $g : B \rightarrow C$, and $h : C \rightarrow D$. Then*

1. *The composition of mappings is associative; that is, $(h \circ g) \circ f = h \circ (g \circ f)$;*
2. *If f and g are both one-to-one, then the mapping $g \circ f$ is one-to-one;*
3. *If f and g are both onto, then the mapping $g \circ f$ is onto;*
4. *If f and g are bijective, then so is $g \circ f$.*

Proof. We will prove (1) and (3). Part (2) is left as an exercise. Part (4) follows directly from (2) and (3).

(1) We must show that

$$h \circ (g \circ f) = (h \circ g) \circ f.$$

For $a \in A$ we have

$$\begin{aligned} (h \circ (g \circ f))(a) &= h((g \circ f)(a)) \\ &= h(g(f(a))) \\ &= (h \circ g)(f(a)) \\ &= ((h \circ g) \circ f)(a). \end{aligned}$$

(3) Assume that f and g are both onto functions. Given $c \in C$, we must show that there exists an $a \in A$ such that $(g \circ f)(a) = g(f(a)) = c$. However, since g is onto, there is an element $b \in B$ such that $g(b) = c$. Similarly, there is an $a \in A$ such that $f(a) = b$. Accordingly,

$$(g \circ f)(a) = g(f(a)) = g(b) = c. \quad \blacksquare$$

If S is any set, we will use id_S or id to denote the **identity mapping** from S to itself. Define this map by $id(s) = s$ for all $s \in S$. A map $g : B \rightarrow A$ is an **inverse mapping** of $f : A \rightarrow B$ if $g \circ f = id_A$ and $f \circ g = id_B$; in other words, the inverse function of a function simply “undoes” the function. A map is said to be **invertible** if it has an inverse. We usually write f^{-1} for the inverse of f .

Example 1.2.16 An Inverse Function. The function $f(x) = x^3$ has inverse $f^{-1}(x) = \sqrt[3]{x}$ by [Example 1.2.12](#). \square

Example 1.2.17 Exponential and Logarithmic Functions are Inverses. The natural logarithm and the exponential functions, $f(x) = \ln x$ and $f^{-1}(x) = e^x$, are inverses of each other provided that we are careful about choosing domains. Observe that

$$f(f^{-1}(x)) = f(e^x) = \ln e^x = x$$

and

$$f^{-1}(f(x)) = f^{-1}(\ln x) = e^{\ln x} = x$$

whenever composition makes sense. \square

Example 1.2.18 A Matrix Inverse Yields an Inverse of a Linear Map. Suppose that

$$A = \begin{pmatrix} 3 & 1 \\ 5 & 2 \end{pmatrix}.$$

Then A defines a map from \mathbb{R}^2 to \mathbb{R}^2 by

$$T_A(x, y) = (3x + y, 5x + 2y).$$

We can find an inverse map of T_A by simply inverting the matrix A ; that is, $T_A^{-1} = T_{A^{-1}}$. In this example,

$$A^{-1} = \begin{pmatrix} 2 & -1 \\ -5 & 3 \end{pmatrix};$$

hence, the inverse map is given by

$$T_A^{-1}(x, y) = (2x - y, -5x + 3y).$$

It is easy to check that

$$T_A^{-1} \circ T_A(x, y) = T_A \circ T_A^{-1}(x, y) = (x, y).$$

Not every map has an inverse. If we consider the map

$$T_B(x, y) = (3x, 0)$$

given by the matrix

$$B = \begin{pmatrix} 3 & 0 \\ 0 & 0 \end{pmatrix},$$

then an inverse map would have to be of the form

$$T_B^{-1}(x, y) = (ax + by, cx + dy)$$

and

$$(x, y) = T \circ T_B^{-1}(x, y) = (3ax + 3by, 0)$$

for all x and y . Clearly this is impossible because y might not be 0. \square

Example 1.2.19 An Inverse Permutation. Given the permutation

$$\pi = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 3 & 1 \end{pmatrix}$$

on $S = \{1, 2, 3\}$, it is easy to see that the permutation defined by

$$\pi^{-1} = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 1 & 2 \end{pmatrix}$$

is the inverse of π . In fact, any bijective mapping possesses an inverse, as we will see in the next theorem. \square

Theorem 1.2.20 *A mapping is invertible if and only if it is both one-to-one and onto.*

Proof. Suppose first that $f : A \rightarrow B$ is invertible with inverse $g : B \rightarrow A$. Then $g \circ f = id_A$ is the identity map; that is, $g(f(a)) = a$. If $a_1, a_2 \in A$ with $f(a_1) = f(a_2)$, then $a_1 = g(f(a_1)) = g(f(a_2)) = a_2$. Consequently, f is one-to-one. Now suppose that $b \in B$. To show that f is onto, it is necessary to find an $a \in A$ such that $f(a) = b$, but $f(g(b)) = b$ with $g(b) \in A$. Let $a = g(b)$.

Conversely, let f be bijective and let $b \in B$. Since f is onto, there exists an $a \in A$ such that $f(a) = b$. Because f is one-to-one, a must be unique. Define g by letting $g(b) = a$. We have now constructed the inverse of f . \blacksquare

1.2.3 Equivalence Relations and Partitions

A fundamental notion in mathematics is that of equality. We can generalize equality with equivalence relations and equivalence classes. An **equivalence relation** on a set X is a relation $R \subset X \times X$ such that

- $(x, x) \in R$ for all $x \in X$ (**reflexive property**);
- $(x, y) \in R$ implies $(y, x) \in R$ (**symmetric property**);
- (x, y) and $(y, z) \in R$ imply $(x, z) \in R$ (**transitive property**).

Given an equivalence relation R on a set X , we usually write $x \sim y$ instead of $(x, y) \in R$. If the equivalence relation already has an associated notation such as $=$, \equiv , or \cong , we will use that notation.

Example 1.2.21 Equivalent Fractions. Let p, q, r , and s be integers, where q and s are nonzero. Define $p/q \sim r/s$ if $ps = qr$. Clearly \sim is reflexive and symmetric. To show that it is also transitive, suppose that $p/q \sim r/s$ and $r/s \sim t/u$, with q, s , and u all nonzero. Then $ps = qr$ and $ru = st$. Therefore,

$$psu = qru = qst.$$

Since $s \neq 0$, $pu = qt$. Consequently, $p/q \sim t/u$. \square

Example 1.2.22 An Equivalence Relation From Derivatives. Suppose that f and g are differentiable functions on \mathbb{R} . We can define an equivalence relation on such functions by letting $f(x) \sim g(x)$ if $f'(x) = g'(x)$. It is clear that \sim is both reflexive and symmetric. To demonstrate transitivity, suppose that $f(x) \sim g(x)$ and $g(x) \sim h(x)$. From calculus we know that $f(x) - g(x) = c_1$ and $g(x) - h(x) = c_2$, where c_1 and c_2 are both constants. Hence,

$$f(x) - h(x) = (f(x) - g(x)) + (g(x) - h(x)) = c_1 - c_2$$

and $f'(x) - h'(x) = 0$. Therefore, $f(x) \sim h(x)$. \square

Example 1.2.23 Equivalent Circles. For (x_1, y_1) and (x_2, y_2) in \mathbb{R}^2 , define $(x_1, y_1) \sim (x_2, y_2)$ if $x_1^2 + y_1^2 = x_2^2 + y_2^2$. Then \sim is an equivalence relation on \mathbb{R}^2 . \square

Example 1.2.24 Equivalent Matrices. Let A and B be 2×2 matrices with entries in the real numbers. We can define an equivalence relation on the set of 2×2 matrices, by saying $A \sim B$ if there exists an invertible matrix P such that $PAP^{-1} = B$. For example, if

$$A = \begin{pmatrix} 1 & 2 \\ -1 & 1 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} -18 & 33 \\ -11 & 20 \end{pmatrix},$$

then $A \sim B$ since $PAP^{-1} = B$ for

$$P = \begin{pmatrix} 2 & 5 \\ 1 & 3 \end{pmatrix}.$$

Let I be the 2×2 identity matrix; that is,

$$I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}.$$

Then $IAI^{-1} = IAI = A$; therefore, the relation is reflexive. To show symmetry, suppose that $A \sim B$. Then there exists an invertible matrix P such that $PAP^{-1} = B$. So

$$A = P^{-1}BP = P^{-1}B(P^{-1})^{-1}.$$

Finally, suppose that $A \sim B$ and $B \sim C$. Then there exist invertible matrices P and Q such that $PAP^{-1} = B$ and $QBQ^{-1} = C$. Since

$$C = QBQ^{-1} = QPAP^{-1}Q^{-1} = (QP)A(QP)^{-1},$$

the relation is transitive. Two matrices that are equivalent in this manner are said to be **similar**. \square

A **partition** \mathcal{P} of a set X is a collection of nonempty sets X_1, X_2, \dots such that $X_i \cap X_j = \emptyset$ for $i \neq j$ and $\bigcup_k X_k = X$. Let \sim be an equivalence relation on a set X and let $x \in X$. Then $[x] = \{y \in X : y \sim x\}$ is called the **equivalence class** of x . We will see that an equivalence relation gives rise to a partition via equivalence classes. Also, whenever a partition of a set exists, there is some natural underlying equivalence relation, as the following theorem demonstrates.

Theorem 1.2.25 *Given an equivalence relation \sim on a set X , the equivalence classes of X form a partition of X . Conversely, if $\mathcal{P} = \{X_i\}$ is a partition of a set X , then there is an equivalence relation on X with equivalence classes X_i .*

Proof. Suppose there exists an equivalence relation \sim on the set X . For any $x \in X$, the reflexive property shows that $x \in [x]$ and so $[x]$ is nonempty. Clearly $X = \bigcup_{x \in X} [x]$. Now let $x, y \in X$. We need to show that either $[x] = [y]$ or $[x] \cap [y] = \emptyset$. Suppose that the intersection of $[x]$ and $[y]$ is not empty and that $z \in [x] \cap [y]$. Then $z \sim x$ and $z \sim y$. By symmetry and transitivity $x \sim y$; hence, $[x] \subset [y]$. Similarly, $[y] \subset [x]$ and so $[x] = [y]$. Therefore, any two equivalence classes are either disjoint or exactly the same.

Conversely, suppose that $\mathcal{P} = \{X_i\}$ is a partition of a set X . Let two elements be equivalent if they are in the same partition. Clearly, the relation is reflexive. If x is in the same partition as y , then y is in the same partition as x , so $x \sim y$ implies $y \sim x$. Finally, if x is in the same partition as y and y

is in the same partition as z , then x must be in the same partition as z , and transitivity holds. ■

Corollary 1.2.26 *Two equivalence classes of an equivalence relation are either disjoint or equal.*

Let us examine some of the partitions given by the equivalence classes in the last set of examples.

Example 1.2.27 A Partition of Fractions. In the equivalence relation in [Example 1.2.21](#), two pairs of integers, (p, q) and (r, s) , are in the same equivalence class when they reduce to the same fraction in its lowest terms. □

Example 1.2.28 A Partition of Functions. In the equivalence relation in [Example 1.2.22](#), two functions $f(x)$ and $g(x)$ are in the same partition when they differ by a constant. □

Example 1.2.29 A Partition of Circles. We defined an equivalence class on \mathbb{R}^2 by $(x_1, y_1) \sim (x_2, y_2)$ if $x_1^2 + y_1^2 = x_2^2 + y_2^2$. Two pairs of real numbers are in the same partition when they lie on the same circle about the origin. □

Example 1.2.30 A Partition of Integers. Let r and s be two integers and suppose that $n \in \mathbb{N}$. We say that r is **congruent to s modulo n** , or r is congruent to $s \pmod{n}$, if $r - s$ is evenly divisible by n ; that is, $r - s = nk$ for some $k \in \mathbb{Z}$. In this case we write $r \equiv s \pmod{n}$. For example, $41 \equiv 17 \pmod{8}$ since $41 - 17 = 24$ is divisible by 8. We claim that congruence modulo n forms an equivalence relation of \mathbb{Z} . Certainly any integer r is equivalent to itself since $r - r = 0$ is divisible by n . We will now show that the relation is symmetric. If $r \equiv s \pmod{n}$, then $r - s = nk$ is divisible by n . So $s - r = -nk$ is divisible by n and $s \equiv r \pmod{n}$. Now suppose that $r \equiv s \pmod{n}$ and $s \equiv t \pmod{n}$. Then there exist integers k and l such that $r - s = nk$ and $s - t = ln$. To show transitivity, it is necessary to prove that $r - t$ is divisible by n . However,

$$r - t = r - s + s - t = nk + ln = (k + l)n,$$

and so $r - t$ is divisible by n .

If we consider the equivalence relation established by the integers modulo 3, then

$$[0] = \{\dots, -3, 0, 3, 6, \dots\},$$

$$[1] = \{\dots, -2, 1, 4, 7, \dots\},$$

$$[2] = \{\dots, -1, 2, 5, 8, \dots\}.$$

Notice that $[0] \cup [1] \cup [2] = \mathbb{Z}$ and also that the sets are disjoint. The sets $[0]$, $[1]$, and $[2]$ form a partition of the integers.

The integers modulo n are a very important example in the study of abstract algebra and will become quite useful in our investigation of various algebraic structures such as groups and rings. In our discussion of the integers modulo n we have actually assumed a result known as the division algorithm, which will be stated and proved in [Chapter 2](#). □

1.3 Sage

Sage is a powerful system for studying and exploring many different areas of mathematics. In this textbook, you will study a variety of algebraic structures,

such as groups, rings and fields. Sage does an excellent job of implementing many features of these objects as we will see in the chapters ahead. But here and now, in this initial chapter, we will concentrate on a few general ways of getting the most out of working with Sage.

You may use Sage several different ways. It may be used as a command-line program when installed on your own computer. Or it might be a web application such as the SageMathCloud. Our writing will assume that you are reading this as a worksheet within the Sage Notebook (a web browser interface), or this is a section of the entire book presented as web pages, and you are employing the Sage Cell Server via those pages. After the first few chapters the explanations should work equally well for whatever vehicle you use to execute Sage commands.

1.3.1 Executing Sage Commands

Most of your interaction will be by typing commands into a *compute cell*. If you are reading this in the Sage Notebook or as a webpage version of the book, then you will see a compute cell just below this paragraph. Click once inside the compute cell and if you are in the Sage Notebook, you will get a more distinctive border around it, a blinking cursor inside, plus a cute little “evaluate” link below. At the cursor, type $2+2$ and then click on the evaluate link. Did a 4 appear below the cell? If so, you have successfully sent a command off for Sage to evaluate and you have received back the (correct) answer.

Here is another compute cell. Try evaluating the command `factorial(300)` here. Hmmm. That is quite a big integer! If you see slashes at the end of each line, this means the result is continued onto the next line, since there are 615 total digits in the result.

To make new compute cells in the Sage Notebook (only), hover your mouse just above another compute cell, or just below some output from a compute cell. When you see a skinny blue bar across the width of your worksheet, click and you will open up a new compute cell, ready for input. Note that your worksheet will remember any calculations you make, in the order you make them, no matter where you put the cells, so it is best to stay organized and add new cells at the bottom.

Try placing your cursor just below the monstrous value of $300!$ that you have. Click on the blue bar and try another factorial computation in the new compute cell.

Each compute cell will show output due to only the very last command in the cell. Try to predict the following output before evaluating the cell.

```
a = 10
b = 6
b = b - 10
a = a + 20
a
```

30

The following compute cell will not print anything since the one command does not create output. But it will have an effect, as you can see when you execute the subsequent cell. Notice how this uses the value of `b` from above. Execute this compute cell *once*. Exactly once. Even if it *appears* to do nothing. If you execute the cell twice, your credit card may be charged twice.

```
b = b + 50
```

Now execute this cell, which will produce some output.

```
b + 20
```

66

So `b` came into existence as 6. We subtracted 10 immediately afterward. Then a subsequent cell added 50. This assumes you executed this cell *exactly* once! In the last cell we create `b+20` (but do not save it) and it is this value (66) that is output, while `b` is still 46.

You can combine several commands on one line with a semi-colon. This is a great way to get multiple outputs from a compute cell. The syntax for building a matrix should be somewhat obvious when you see the output, but if not, it is not particularly important to understand now.

```
A = matrix([[3, 1], [5, 2]]); A
```

```
[3 1]
[5 2]
```

```
print A; print ; A.inverse()
```

```
[3 1]
[5 2]
<BLANKLINE>
[ 2 -1]
[-5  3]
```

1.3.2 Immediate Help

Some commands in Sage are “functions,” an example is `factorial()` above. Other commands are “methods” of an object and are like characteristics of objects, an example is `.inverse()` as a method of a matrix. Once you know how to create an object (such as a matrix), then it is easy to see all the available methods. Write the name of the object, place a period (“dot”) and hit the TAB key. If you have `A` defined from above, then the compute cell below is ready to go, click into it and then hit TAB (not “evaluate”!). You should get a long list of possible methods.

```
A.
```

To get some help on how to use a method with an object, write its name after a dot (with no parentheses) and then use a question-mark and hit TAB. (Hit the escape key “ESC” to remove the list, or click on the text for a method.)

```
A.inverse?
```

With one more question-mark and a TAB you can see the actual computer instructions that were programmed into Sage to make the method work, once you scroll down past the documentation delimited by the triple quotes (“””):

```
A.inverse??
```

It is worthwhile to see what Sage does when there is an error. You will probably see a lot of these at first, and initially they will be a bit intimidating. But with time, you will learn how to use them effectively and you will also become more proficient with Sage and see them less often. Execute the compute cell below, it asks for the inverse of a matrix that has no inverse. Then reread the commentary.

```
B = matrix([[2, 20], [5, 50]])
B.inverse()
```

```
Traceback (most recent call last):
...
ZeroDivisionError: Matrix is singular
```

Click just to the left of the error message to expand it fully (another click hides it totally, and a third click brings back the abbreviated form). Read the bottom of an error message first, it is your best explanation. Here a `ZeroDivisionError` is not 100% accurate, but is close. The matrix is not invertible, not dissimilar to how we cannot divide scalars by zero. The remainder of the message begins at the top showing where the error first happened in your code and then the various places where intermediate functions were called, until the actual piece of Sage where the problem occurred. Sometimes this information will give you some clues, sometimes it is totally undecipherable. So do not let it scare you if it seems mysterious, but do remember to always read the last line first, then go back and read the first few lines for something that looks like your code.

1.3.3 Annotating Your Work

It is easy to comment on your work when you use the Sage Notebook. (The following only applies if you are reading this within a Sage Notebook. If you are not, then perhaps you can go open up a worksheet in the Sage Notebook and experiment there.) You can open up a small word-processor by hovering your mouse until you get a skinny blue bar again, but now when you click, also hold the SHIFT key at the same time. Experiment with fonts, colors, bullet lists, etc and then click the “Save changes” button to exit. Double-click on your text if you need to go back and edit it later.

Open the word-processor again to create a new bit of text (maybe next to the empty compute cell just below). Type all of the following *exactly*:

```
Pythagorean Theorem: $c^2=a^2+b^2$
```

and save your changes. The symbols between the dollar signs are written according to the mathematical typesetting language known as \TeX — cruise the internet to learn more about this very popular tool. (Well, it is extremely popular among mathematicians and physical scientists.)

1.3.4 Lists

Much of our interaction with sets will be through Sage lists. These are not really sets — they allow duplicates, and order matters. But they are so close to sets, and so easy and powerful to use that we will use them regularly. We will use a fun made-up list for practice, the quote marks mean the items are just text, with no special mathematical meaning. Execute these compute cells as we work through them.

```
zoo = ['snake', 'parrot', 'elephant', 'baboon', 'beetle']
zoo
```

```
['snake', 'parrot', 'elephant', 'baboon', 'beetle']
```

So the square brackets define the boundaries of our list, commas separate items, and we can give the list a name. To work with just one element of the list, we use the name and a pair of brackets with an index. Notice that lists have

indices that *begin counting at zero*. This will seem odd at first and will seem very natural later.

```
zoo[2]
```

```
'elephant'
```

We can add a new creature to the zoo, it is joined up at the far right end.

```
zoo.append('ostrich'); zoo
```

```
['snake', 'parrot', 'elephant', 'baboon', 'beetle', 'ostrich']
```

We can remove a creature.

```
zoo.remove('parrot')
zoo
```

```
['snake', 'elephant', 'baboon', 'beetle', 'ostrich']
```

We can extract a sublist. Here we start with element 1 (the elephant) and go all the way up to, *but not including*, element 3 (the beetle). Again a bit odd, but it will feel natural later. For now, notice that we are extracting two elements of the lists, exactly $3 - 1 = 2$ elements.

```
mammals = zoo[1:3]
mammals
```

```
['elephant', 'baboon']
```

Often we will want to see if two lists are equal. To do that we will need to sort a list first. A function creates a new, sorted list, leaving the original alone. So we need to save the new one with a new name.

```
newzoo = sorted(zoo)
newzoo
```

```
['baboon', 'beetle', 'elephant', 'ostrich', 'snake']
```

```
zoo.sort()
zoo
```

```
['baboon', 'beetle', 'elephant', 'ostrich', 'snake']
```

Notice that if you run this last compute cell your zoo has changed and some commands above will not necessarily execute the same way. If you want to experiment, go all the way back to the first creation of the zoo and start executing cells again from there with a fresh zoo.

A construction called a **list comprehension** is especially powerful, especially since it almost exactly mirrors notation we use to describe sets. Suppose we want to form the plural of the names of the creatures in our zoo. We build a new list, based on all of the elements of our old list.

```
plurality_zoo = [animal+'s' for animal in zoo]
plurality_zoo
```

```
['baboons', 'beetles', 'elephants', 'ostrichs', 'snakes']
```

Almost like it says: we add an “s” to each animal name, for each animal in the zoo, and place them in a new list. Perfect. (Except for getting the plural of “ostrich” wrong.)

1.3.5 Lists of Integers

One final type of list, with numbers this time. The `srange()` function will create lists of integers. (The “s” in the name stands for “Sage” and so will produce integers that Sage understands best. Many early difficulties with Sage and group theory can be alleviated by using only this command to create lists of integers.) In its simplest form an invocation like `srange(12)` will create a list of 12 integers, *starting at zero* and working up to, *but not including*, 12. Does this sound familiar?

```
dozen = srange(12); dozen
```

```
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11]
```

Here are two other forms, that you should be able to understand by studying the examples.

```
teens = srange(13, 20); teens
```

```
[13, 14, 15, 16, 17, 18, 19]
```

```
decades = srange(1900, 2000, 10); decades
```

```
[1900, 1910, 1920, 1930, 1940, 1950, 1960, 1970, 1980, 1990]
```

1.3.6 Saving and Sharing Your Work

There is a “Save” button in the upper-right corner of the Sage Notebook. This will save a current copy of your worksheet that you can retrieve your work from within your notebook again later, though you have to re-execute all the cells when you re-open the worksheet.

There is also a “File” drop-down list, on the left, just above your very top compute cell (not be confused with your browser’s File menu item!). You will see a choice here labeled “Save worksheet to a file...” When you do this, you are creating a copy of your worksheet in the `sws` format (short for “Sage WorkSheet”). You can email this file, or post it on a website, for other Sage users and they can use the “Upload” link on the homepage of their notebook to incorporate a copy of your worksheet into their notebook.

There are other ways to share worksheets that you can experiment with, but this gives you one way to share any worksheet with anybody almost anywhere.

We have covered a lot here in this section, so come back later to pick up tidbits you might have missed. There are also many more features in the Sage Notebook that we have not covered.

1.4 Exercises

- Suppose that

$$A = \{x : x \in \mathbb{N} \text{ and } x \text{ is even}\},$$

$$B = \{x : x \in \mathbb{N} \text{ and } x \text{ is prime}\},$$

$$C = \{x : x \in \mathbb{N} \text{ and } x \text{ is a multiple of } 5\}.$$

Describe each of the following sets.

(a) $A \cap B$

(c) $A \cup B$

(b) $B \cap C$

(d) $A \cap (B \cup C)$

Hint. (a) $A \cap B = \{2\}$; (b) $B \cap C = \{5\}$.

2. If $A = \{a, b, c\}$, $B = \{1, 2, 3\}$, $C = \{x\}$, and $D = \emptyset$, list all of the elements in each of the following sets.

(a) $A \times B$

(c) $A \times B \times C$

(b) $B \times A$

(d) $A \times D$

Hint. (a) $A \times B = \{(a, 1), (a, 2), (a, 3), (b, 1), (b, 2), (b, 3), (c, 1), (c, 2), (c, 3)\}$;
(d) $A \times D = \emptyset$.

3. Find an example of two nonempty sets A and B for which $A \times B = B \times A$ is true.
4. Prove $A \cup \emptyset = A$ and $A \cap \emptyset = \emptyset$.
5. Prove $A \cup B = B \cup A$ and $A \cap B = B \cap A$.
6. Prove $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$.

Hint. If $x \in A \cup (B \cap C)$, then either $x \in A$ or $x \in B \cap C$. Thus, $x \in A \cup B$ and $A \cup C$. Hence, $x \in (A \cup B) \cap (A \cup C)$. Therefore, $A \cup (B \cap C) \subset (A \cup B) \cap (A \cup C)$. Conversely, if $x \in (A \cup B) \cap (A \cup C)$, then $x \in A \cup B$ and $A \cup C$. Thus, $x \in A$ or x is in both B and C . So $x \in A \cup (B \cap C)$ and therefore $(A \cup B) \cap (A \cup C) \subset A \cup (B \cap C)$. Hence, $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$.

7. Prove $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$.
8. Prove $A \subset B$ if and only if $A \cap B = A$.
9. Prove $(A \cap B)' = A' \cup B'$.
10. Prove $A \cup B = (A \cap B) \cup (A \setminus B) \cup (B \setminus A)$.

Hint. $(A \cap B) \cup (A \setminus B) \cup (B \setminus A) = (A \cap B) \cup (A \cap B') \cup (B \cap A') = [A \cap (B \cup B')] \cup (B \cap A') = A \cup (B \cap A') = (A \cup B) \cap (A \cup A') = A \cup B$.

11. Prove $(A \cup B) \times C = (A \times C) \cup (B \times C)$.
12. Prove $(A \cap B) \setminus B = \emptyset$.
13. Prove $(A \cup B) \setminus B = A \setminus B$.
14. Prove $A \setminus (B \cup C) = (A \setminus B) \cap (A \setminus C)$.

Hint. $A \setminus (B \cup C) = A \cap (B \cup C)' = (A \cap A) \cap (B' \cap C') = (A \cap B') \cap (A \cap C') = (A \setminus B) \cap (A \setminus C)$.

15. Prove $A \cap (B \setminus C) = (A \cap B) \setminus (A \cap C)$.
16. Prove $(A \setminus B) \cup (B \setminus A) = (A \cup B) \setminus (A \cap B)$.

17. Which of the following relations $f : \mathbb{Q} \rightarrow \mathbb{Q}$ define a mapping? In each case, supply a reason why f is or is not a mapping.

(a) $f(p/q) = \frac{p+1}{p-2}$

(c) $f(p/q) = \frac{p+q}{q^2}$

(b) $f(p/q) = \frac{3p}{3q}$

(d) $f(p/q) = \frac{3p^2}{7q^2} - \frac{p}{q}$

Hint. (a) Not a map since $f(2/3)$ is undefined; (b) this is a map; (c) not a map, since $f(1/2) = 3/4$ but $f(2/4) = 3/8$; (d) this is a map.

18. Determine which of the following functions are one-to-one and which are onto. If the function is not onto, determine its range.

(a) $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = e^x$

- (b) $f : \mathbb{Z} \rightarrow \mathbb{Z}$ defined by $f(n) = n^2 + 3$
- (c) $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = \sin x$
- (d) $f : \mathbb{Z} \rightarrow \mathbb{Z}$ defined by $f(x) = x^2$

Hint. (a) f is one-to-one but not onto. $f(\mathbb{R}) = \{x \in \mathbb{R} : x > 0\}$. (c) f is neither one-to-one nor onto. $f(\mathbb{R}) = \{x : -1 \leq x \leq 1\}$.

19. Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be invertible mappings; that is, mappings such that f^{-1} and g^{-1} exist. Show that $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$.

20.

- (a) Define a function $f : \mathbb{N} \rightarrow \mathbb{N}$ that is one-to-one but not onto.
- (b) Define a function $f : \mathbb{N} \rightarrow \mathbb{N}$ that is onto but not one-to-one.

Hint. (a) $f(n) = n + 1$.

21. Prove the relation defined on \mathbb{R}^2 by $(x_1, y_1) \sim (x_2, y_2)$ if $x_1^2 + y_1^2 = x_2^2 + y_2^2$ is an equivalence relation.

22. Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be maps.

- (a) If f and g are both one-to-one functions, show that $g \circ f$ is one-to-one.
- (b) If $g \circ f$ is onto, show that g is onto.
- (c) If $g \circ f$ is one-to-one, show that f is one-to-one.
- (d) If $g \circ f$ is one-to-one and f is onto, show that g is one-to-one.
- (e) If $g \circ f$ is onto and g is one-to-one, show that f is onto.

Hint. (a) Let $x, y \in A$. Then $g(f(x)) = (g \circ f)(x) = (g \circ f)(y) = g(f(y))$. Thus, $f(x) = f(y)$ and $x = y$, so $g \circ f$ is one-to-one. (b) Let $c \in C$, then $c = (g \circ f)(x) = g(f(x))$ for some $x \in A$. Since $f(x) \in B$, g is onto.

23. Define a function on the real numbers by

$$f(x) = \frac{x+1}{x-1}.$$

What are the domain and range of f ? What is the inverse of f ? Compute $f \circ f^{-1}$ and $f^{-1} \circ f$.

Hint. $f^{-1}(x) = (x+1)/(x-1)$.

24. Let $f : X \rightarrow Y$ be a map with $A_1, A_2 \subset X$ and $B_1, B_2 \subset Y$.

- (a) Prove $f(A_1 \cup A_2) = f(A_1) \cup f(A_2)$.
- (b) Prove $f(A_1 \cap A_2) \subset f(A_1) \cap f(A_2)$. Give an example in which equality fails.
- (c) Prove $f^{-1}(B_1 \cup B_2) = f^{-1}(B_1) \cup f^{-1}(B_2)$, where

$$f^{-1}(B) = \{x \in X : f(x) \in B\}.$$

- (d) Prove $f^{-1}(B_1 \cap B_2) = f^{-1}(B_1) \cap f^{-1}(B_2)$.
- (e) Prove $f^{-1}(Y \setminus B_1) = X \setminus f^{-1}(B_1)$.

Hint. (a) Let $y \in f(A_1 \cup A_2)$. Then there exists an $x \in A_1 \cup A_2$ such that $f(x) = y$. Hence, $y \in f(A_1)$ or $f(A_2)$. Therefore, $y \in f(A_1) \cup f(A_2)$. Consequently, $f(A_1 \cup A_2) \subset f(A_1) \cup f(A_2)$. Conversely, if $y \in f(A_1) \cup f(A_2)$, then $y \in f(A_1)$ or $f(A_2)$. Hence, there exists an $x \in A_1$ or there exists an $x \in A_2$ such that $f(x) = y$. Thus, there exists an $x \in A_1 \cup A_2$ such that $f(x) = y$. Therefore, $f(A_1) \cup f(A_2) \subset f(A_1 \cup A_2)$, and $f(A_1 \cup A_2) = f(A_1) \cup f(A_2)$.

25. Determine whether or not the following relations are equivalence relations on the given set. If the relation is an equivalence relation, describe the partition given by it. If the relation is not an equivalence relation, state why it fails to be one.

(a) $x \sim y$ in \mathbb{R} if $x \geq y$

(c) $x \sim y$ in \mathbb{R} if $|x - y| \leq 4$

(b) $m \sim n$ in \mathbb{Z} if $mn > 0$

(d) $m \sim n$ in \mathbb{Z} if $m \equiv n \pmod{6}$

Hint. (a) The relation fails to be symmetric. (b) The relation is not reflexive, since 0 is not equivalent to itself. (c) The relation is not transitive.

26. Define a relation \sim on \mathbb{R}^2 by stating that $(a, b) \sim (c, d)$ if and only if $a^2 + b^2 \leq c^2 + d^2$. Show that \sim is reflexive and transitive but not symmetric.
27. Show that an $m \times n$ matrix gives rise to a well-defined map from \mathbb{R}^n to \mathbb{R}^m .
28. Find the error in the following argument by providing a counterexample. "The reflexive property is redundant in the axioms for an equivalence relation. If $x \sim y$, then $y \sim x$ by the symmetric property. Using the transitive property, we can deduce that $x \sim x$."

Hint. Let $X = \mathbb{N} \cup \{\sqrt{2}\}$ and define $x \sim y$ if $x + y \in \mathbb{N}$.

29. **Projective Real Line.** Define a relation on $\mathbb{R}^2 \setminus \{(0, 0)\}$ by letting $(x_1, y_1) \sim (x_2, y_2)$ if there exists a nonzero real number λ such that $(x_1, y_1) = (\lambda x_2, \lambda y_2)$. Prove that \sim defines an equivalence relation on $\mathbb{R}^2 \setminus \{(0, 0)\}$. What are the corresponding equivalence classes? This equivalence relation defines the projective line, denoted by $\mathbb{P}(\mathbb{R})$, which is very important in geometry.

1.5 Sage Exercises

1. This exercise is just about making sure you know how to use Sage. Log in to a Sage Notebook server and create a new worksheet. Do some non-trivial computation, maybe a pretty plot or some gruesome numerical computation to an insane precision. Create an interesting list and experiment with it some. Maybe include some nicely formatted text or \TeX using the included mini-word-processor of the Sage Notebook (hover until a blue bar appears between cells and then shift-click). Use whatever mechanism your instructor has in place for submitting your work. Or save your worksheet and then trade worksheets via email (or another electronic method) with a classmate.

Chapter 2

The Integers

The integers are the building blocks of mathematics. In this chapter we will investigate the fundamental properties of the integers, including mathematical induction, the division algorithm, and the Fundamental Theorem of Arithmetic.

2.1 Mathematical Induction

Suppose we wish to show that

$$1 + 2 + \cdots + n = \frac{n(n+1)}{2}$$

for any natural number n . This formula is easily verified for small numbers such as $n = 1, 2, 3$, or 4 , but it is impossible to verify for all natural numbers on a case-by-case basis. To prove the formula true in general, a more generic method is required.

Suppose we have verified the equation for the first n cases. We will attempt to show that we can generate the formula for the $(n+1)$ th case from this knowledge. The formula is true for $n = 1$ since

$$1 = \frac{1(1+1)}{2}.$$

If we have verified the first n cases, then

$$\begin{aligned} 1 + 2 + \cdots + n + (n+1) &= \frac{n(n+1)}{2} + n + 1 \\ &= \frac{n^2 + 3n + 2}{2} \\ &= \frac{(n+1)[(n+1) + 1]}{2}. \end{aligned}$$

This is exactly the formula for the $(n+1)$ th case.

This method of proof is known as **mathematical induction**. Instead of attempting to verify a statement about some subset S of the positive integers \mathbb{N} on a case-by-case basis, an impossible task if S is an infinite set, we give a specific proof for the smallest integer being considered, followed by a generic argument showing that if the statement holds for a given case, then it must also hold for the next case in the sequence. We summarize mathematical induction in the following axiom.

Principle 2.1.1 First Principle of Mathematical Induction. Let $S(n)$ be a statement about integers for $n \in \mathbb{N}$ and suppose $S(n_0)$ is true for some integer n_0 . If for all integers k with $k \geq n_0$, $S(k)$ implies that $S(k+1)$ is true, then $S(n)$ is true for all integers n greater than or equal to n_0 .

Example 2.1.2 An Inequality for Powers of 2. For all integers $n \geq 3$, $2^n > n + 4$. Since

$$8 = 2^3 > 3 + 4 = 7,$$

the statement is true for $n_0 = 3$. Assume that $2^k > k + 4$ for $k \geq 3$. Then $2^{k+1} = 2 \cdot 2^k > 2(k+4)$. But

$$2(k+4) = 2k + 8 > k + 5 = (k+1) + 4$$

since k is positive. Hence, by induction, the statement holds for all integers $n \geq 3$. \square

Example 2.1.3 Some Integers Divisible by 9. Every integer $10^{n+1} + 3 \cdot 10^n + 5$ is divisible by 9 for $n \in \mathbb{N}$. For $n = 1$,

$$10^{1+1} + 3 \cdot 10 + 5 = 135 = 9 \cdot 15$$

is divisible by 9. Suppose that $10^{k+1} + 3 \cdot 10^k + 5$ is divisible by 9 for $k \geq 1$. Then

$$\begin{aligned} 10^{(k+1)+1} + 3 \cdot 10^{k+1} + 5 &= 10^{k+2} + 3 \cdot 10^{k+1} + 50 - 45 \\ &= 10(10^{k+1} + 3 \cdot 10^k + 5) - 45 \end{aligned}$$

is divisible by 9. \square

Example 2.1.4 The Binomial Theorem. We will prove the binomial theorem using mathematical induction; that is,

$$(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^k b^{n-k},$$

where a and b are real numbers, $n \in \mathbb{N}$, and

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$

is the binomial coefficient. We first show that

$$\binom{n+1}{k} = \binom{n}{k} + \binom{n}{k-1}.$$

This result follows from

$$\begin{aligned} \binom{n}{k} + \binom{n}{k-1} &= \frac{n!}{k!(n-k)!} + \frac{n!}{(k-1)!(n-k+1)!} \\ &= \frac{(n+1)!}{k!(n+1-k)!} \\ &= \binom{n+1}{k}. \end{aligned}$$

If $n = 1$, the binomial theorem is easy to verify. Now assume that the result is true for n greater than or equal to 1. Then

$$(a+b)^{n+1} = (a+b)(a+b)^n$$

$$\begin{aligned}
&= (a + b) \left(\sum_{k=0}^n \binom{n}{k} a^k b^{n-k} \right) \\
&= \sum_{k=0}^n \binom{n}{k} a^{k+1} b^{n-k} + \sum_{k=0}^n \binom{n}{k} a^k b^{n+1-k} \\
&= a^{n+1} + \sum_{k=1}^n \binom{n}{k-1} a^k b^{n+1-k} + \sum_{k=1}^n \binom{n}{k} a^k b^{n+1-k} + b^{n+1} \\
&= a^{n+1} + \sum_{k=1}^n \left[\binom{n}{k-1} + \binom{n}{k} \right] a^k b^{n+1-k} + b^{n+1} \\
&= \sum_{k=0}^{n+1} \binom{n+1}{k} a^k b^{n+1-k}.
\end{aligned}$$

□

We have an equivalent statement of the Principle of Mathematical Induction that is often very useful.

Principle 2.1.5 Second Principle of Mathematical Induction. *Let $S(n)$ be a statement about integers for $n \in \mathbb{N}$ and suppose $S(n_0)$ is true for some integer n_0 . If $S(n_0), S(n_0 + 1), \dots, S(k)$ imply that $S(k + 1)$ for $k \geq n_0$, then the statement $S(n)$ is true for all integers $n \geq n_0$.*

A nonempty subset S of \mathbb{Z} is **well-ordered** if S contains a least element. Notice that the set \mathbb{Z} is not well-ordered since it does not contain a smallest element. However, the natural numbers are well-ordered.

Principle 2.1.6 Principle of Well-Ordering. *Every nonempty subset of the natural numbers is well-ordered.*

The Principle of Well-Ordering is equivalent to the Principle of Mathematical Induction.

Lemma 2.1.7 *The Principle of Mathematical Induction implies that 1 is the least positive natural number.*

Proof. Let $S = \{n \in \mathbb{N} : n \geq 1\}$. Then $1 \in S$. Now assume that $n \in S$; that is, $n \geq 1$. Since $n + 1 \geq 1$, $n + 1 \in S$; hence, by induction, every natural number is greater than or equal to 1. ■

Theorem 2.1.8 *The Principle of Mathematical Induction implies the Principle of Well-Ordering. That is, every nonempty subset of \mathbb{N} contains a least element.*

Proof. We must show that if S is a nonempty subset of the natural numbers, then S contains a least element. If S contains 1, then the theorem is true by [Lemma 2.1.7](#). Assume that if S contains an integer k such that $1 \leq k \leq n$, then S contains a least element. We will show that if a set S contains an integer less than or equal to $n + 1$, then S has a least element. If S does not contain an integer less than $n + 1$, then $n + 1$ is the smallest integer in S . Otherwise, since S is nonempty, S must contain an integer less than or equal to n . In this case, by induction, S contains a least element. ■

Induction can also be very useful in formulating definitions. For instance, there are two ways to define $n!$, the factorial of a positive integer n .

- The *explicit* definition: $n! = 1 \cdot 2 \cdot 3 \cdots (n - 1) \cdot n$.
- The *inductive* or *recursive* definition: $1! = 1$ and $n! = n(n - 1)!$ for $n > 1$.

Every good mathematician or computer scientist knows that looking at problems recursively, as opposed to explicitly, often results in better understanding of complex issues.

2.2 The Division Algorithm

An application of the Principle of Well-Ordering that we will use often is the division algorithm.

Theorem 2.2.1 Division Algorithm. *Let a and b be integers, with $b > 0$. Then there exist unique integers q and r such that*

$$a = bq + r$$

where $0 \leq r < b$.

Proof. This is a perfect example of the existence-and-uniqueness type of proof. We must first prove that the numbers q and r actually exist. Then we must show that if q' and r' are two other such numbers, then $q = q'$ and $r = r'$.

Existence of q and r . Let

$$S = \{a - bk : k \in \mathbb{Z} \text{ and } a - bk \geq 0\}.$$

If $0 \in S$, then b divides a , and we can let $q = a/b$ and $r = 0$. If $0 \notin S$, we can use the Well-Ordering Principle. We must first show that S is nonempty. If $a > 0$, then $a - b \cdot 0 \in S$. If $a < 0$, then $a - b(2a) = a(1 - 2b) \in S$. In either case $S \neq \emptyset$. By the Well-Ordering Principle, S must have a smallest member, say $r = a - bq$. Therefore, $a = bq + r$, $r \geq 0$. We now show that $r < b$. Suppose that $r > b$. Then

$$a - b(q + 1) = a - bq - b = r - b > 0.$$

In this case we would have $a - b(q + 1)$ in the set S . But then $a - b(q + 1) < a - bq$, which would contradict the fact that $r = a - bq$ is the smallest member of S . So $r \leq b$. Since $0 \notin S$, $r \neq b$ and so $r < b$.

Uniqueness of q and r . Suppose there exist integers r, r', q , and q' such that

$$a = bq + r, 0 \leq r < b \quad \text{and} \quad a = bq' + r', 0 \leq r' < b.$$

Then $bq + r = bq' + r'$. Assume that $r' \geq r$. From the last equation we have $b(q - q') = r' - r$; therefore, b must divide $r' - r$ and $0 \leq r' - r \leq r' < b$. This is possible only if $r' - r = 0$. Hence, $r = r'$ and $q = q'$. ■

Let a and b be integers. If $b = ak$ for some integer k , we write $a \mid b$. An integer d is called a **common divisor** of a and b if $d \mid a$ and $d \mid b$. The **greatest common divisor** of integers a and b is a positive integer d such that d is a common divisor of a and b and if d' is any other common divisor of a and b , then $d' \mid d$. We write $d = \gcd(a, b)$; for example, $\gcd(24, 36) = 12$ and $\gcd(120, 102) = 6$. We say that two integers a and b are **relatively prime** if $\gcd(a, b) = 1$.

Theorem 2.2.2 *Let a and b be nonzero integers. Then there exist integers r and s such that*

$$\gcd(a, b) = ar + bs.$$

Furthermore, the greatest common divisor of a and b is unique.

Proof. Let

$$S = \{am + bn : m, n \in \mathbb{Z} \text{ and } am + bn > 0\}.$$

Clearly, the set S is nonempty; hence, by the Well-Ordering Principle S must have a smallest member, say $d = ar + bs$. We claim that $d = \gcd(a, b)$. Write $a = dq + r'$ where $0 \leq r' < d$. If $r' > 0$, then

$$\begin{aligned} r' &= a - dq \\ &= a - (ar + bs)q \\ &= a - arq - bsq \\ &= a(1 - rq) + b(-sq), \end{aligned}$$

which is in S . But this would contradict the fact that d is the smallest member of S . Hence, $r' = 0$ and d divides a . A similar argument shows that d divides b . Therefore, d is a common divisor of a and b .

Suppose that d' is another common divisor of a and b , and we want to show that $d' \mid d$. If we let $a = d'h$ and $b = d'k$, then

$$d = ar + bs = d'hr + d'ks = d'(hr + ks).$$

So d' must divide d . Hence, d must be the unique greatest common divisor of a and b . ■

Corollary 2.2.3 *Let a and b be two integers that are relatively prime. Then there exist integers r and s such that $ar + bs = 1$.*

2.2.1 The Euclidean Algorithm

Among other things, [Theorem 2.2.2](#) allows us to compute the greatest common divisor of two integers.

Example 2.2.4 Greatest Common Divisor of Two Integers. Let us compute the greatest common divisor of 945 and 2415. First observe that

$$\begin{aligned} 2415 &= 945 \cdot 2 + 525 \\ 945 &= 525 \cdot 1 + 420 \\ 525 &= 420 \cdot 1 + 105 \\ 420 &= 105 \cdot 4 + 0. \end{aligned}$$

Reversing our steps, 105 divides 420, 105 divides 525, 105 divides 945, and 105 divides 2415. Hence, 105 divides both 945 and 2415. If d were another common divisor of 945 and 2415, then d would also have to divide 105. Therefore, $\gcd(945, 2415) = 105$.

If we work backward through the above sequence of equations, we can also obtain numbers r and s such that $945r + 2415s = 105$. Observe that

$$\begin{aligned} 105 &= 525 + (-1) \cdot 420 \\ &= 525 + (-1) \cdot [945 + (-1) \cdot 525] \\ &= 2 \cdot 525 + (-1) \cdot 945 \\ &= 2 \cdot [2415 + (-2) \cdot 945] + (-1) \cdot 945 \\ &= 2 \cdot 2415 + (-5) \cdot 945. \end{aligned}$$

So $r = -5$ and $s = 2$. Notice that r and s are not unique, since $r = 41$ and $s = -16$ would also work. □

To compute $\gcd(a, b) = d$, we are using repeated divisions to obtain a decreasing sequence of positive integers $r_1 > r_2 > \cdots > r_n = d$; that is,

$$\begin{aligned} b &= aq_1 + r_1 \\ a &= r_1q_2 + r_2 \\ r_1 &= r_2q_3 + r_3 \\ &\vdots \\ r_{n-2} &= r_{n-1}q_n + r_n \\ r_{n-1} &= r_nq_{n+1}. \end{aligned}$$

To find r and s such that $ar + bs = d$, we begin with this last equation and substitute results obtained from the previous equations:

$$\begin{aligned} d &= r_n \\ &= r_{n-2} - r_{n-1}q_n \\ &= r_{n-2} - q_n(r_{n-3} - q_{n-1}r_{n-2}) \\ &= -q_nr_{n-3} + (1 + q_nq_{n-1})r_{n-2} \\ &\vdots \\ &= ra + sb. \end{aligned}$$

The algorithm that we have just used to find the greatest common divisor d of two integers a and b and to write d as the linear combination of a and b is known as the **Euclidean algorithm**.

2.2.2 Prime Numbers

Let p be an integer such that $p > 1$. We say that p is a **prime number**, or simply p is **prime**, if the only positive numbers that divide p are 1 and p itself. An integer $n > 1$ that is not prime is said to be **composite**.

Lemma 2.2.5 (Euclid) *Let a and b be integers and p be a prime number. If $p \mid ab$, then either $p \mid a$ or $p \mid b$.*

Proof. Suppose that p does not divide a . We must show that $p \mid b$. Since $\gcd(a, p) = 1$, there exist integers r and s such that $ar + ps = 1$. So

$$b = b(ar + ps) = (ab)r + p(bs).$$

Since p divides both ab and itself, p must divide $b = (ab)r + p(bs)$. ■

Theorem 2.2.6 (Euclid) *There exist an infinite number of primes.*

Proof. We will prove this theorem by contradiction. Suppose that there are only a finite number of primes, say p_1, p_2, \dots, p_n . Let $P = p_1p_2 \cdots p_n + 1$. Then P must be divisible by some p_i for $1 \leq i \leq n$. In this case, p_i must divide $P - p_1p_2 \cdots p_n = 1$, which is a contradiction. Hence, either P is prime or there exists an additional prime number $p \neq p_i$ that divides P . ■

Theorem 2.2.7 Fundamental Theorem of Arithmetic. *Let n be an integer such that $n > 1$. Then*

$$n = p_1p_2 \cdots p_k,$$

where p_1, \dots, p_k are primes (not necessarily distinct). Furthermore, this factorization is unique; that is, if

$$n = q_1 q_2 \cdots q_l,$$

then $k = l$ and the q_i 's are just the p_i 's rearranged.

Proof. Uniqueness. To show uniqueness we will use induction on n . The theorem is certainly true for $n = 2$ since in this case n is prime. Now assume that the result holds for all integers m such that $1 \leq m < n$, and

$$n = p_1 p_2 \cdots p_k = q_1 q_2 \cdots q_l,$$

where $p_1 \leq p_2 \leq \cdots \leq p_k$ and $q_1 \leq q_2 \leq \cdots \leq q_l$. By Lemma 2.2.5, $p_1 \mid q_i$ for some $i = 1, \dots, l$ and $q_1 \mid p_j$ for some $j = 1, \dots, k$. Since all of the p_i 's and q_i 's are prime, $p_1 = q_i$ and $q_1 = p_j$. Hence, $p_1 = q_1$ since $p_1 \leq p_j = q_1 \leq q_i = p_1$. By the induction hypothesis,

$$n' = p_2 \cdots p_k = q_2 \cdots q_l$$

has a unique factorization. Hence, $k = l$ and $q_i = p_i$ for $i = 1, \dots, k$.

Existence. To show existence, suppose that there is some integer that cannot be written as the product of primes. Let S be the set of all such numbers. By the Principle of Well-Ordering, S has a smallest number, say a . If the only positive factors of a are a and 1, then a is prime, which is a contradiction. Hence, $a = a_1 a_2$ where $1 < a_1 < a$ and $1 < a_2 < a$. Neither $a_1 \in S$ nor $a_2 \in S$, since a is the smallest element in S . So

$$\begin{aligned} a_1 &= p_1 \cdots p_r \\ a_2 &= q_1 \cdots q_s. \end{aligned}$$

Therefore,

$$a = a_1 a_2 = p_1 \cdots p_r q_1 \cdots q_s.$$

So $a \notin S$, which is a contradiction. ■

2.2.3 Historical Note

Prime numbers were first studied by the ancient Greeks. Two important results from antiquity are Euclid's proof that an infinite number of primes exist and the Sieve of Eratosthenes, a method of computing all of the prime numbers less than a fixed positive integer n . One problem in number theory is to find a function f such that $f(n)$ is prime for each integer n . Pierre Fermat (1601?–1665) conjectured that $2^{2^n} + 1$ was prime for all n , but later it was shown by Leonhard Euler (1707–1783) that

$$2^{2^5} + 1 = 4,294,967,297$$

is a composite number. One of the many unproven conjectures about prime numbers is Goldbach's Conjecture. In a letter to Euler in 1742, Christian Goldbach stated the conjecture that every even integer with the exception of 2 seemed to be the sum of two primes: $4 = 2 + 2$, $6 = 3 + 3$, $8 = 3 + 5$, \dots . Although the conjecture has been verified for the numbers up through 4×10^{18} , it has yet to be proven in general. Since prime numbers play an important role in public key cryptography, there is currently a great deal of interest in determining whether or not a large number is prime.

Remark 2.2.8 Sage. Sage's original purpose was to support research in number theory, so it is perfect for the types of computations with the integers that we have in this chapter.

2.3 Sage

Many properties of the algebraic objects we will study can be determined from properties of associated integers. And Sage has many powerful functions for analyzing integers.

2.3.1 Division Algorithm

The code `a % b` will return the remainder upon division of a by b . In other words, the result is the unique integer r such that (1) $0 \leq r < b$, and (2) $a = bq + r$ for some integer q (the quotient), as guaranteed by the Division Algorithm ([Theorem 2.2.1](#)). Then $(a - r)/b$ will equal q . For example,

```
r = 14 % 3
r
```

2

```
q = (14 - r)/3
q
```

4

It is also possible to get both the quotient and remainder at the same time with the `.quo_rem()` method (quotient and remainder).

```
a = 14
b = 3
a.quo_rem(b)
```

(4, 2)

A remainder of zero indicates divisibility. So `(a % b) == 0` will return `True` if b divides a , and will otherwise return `False`.

```
(20 % 5) == 0
```

True

```
(17 % 4) == 0
```

False

The `.divides()` method is another option.

```
c = 5
c.divides(20)
```

True

```
d = 4
d.divides(17)
```

False

2.3.2 Greatest Common Divisor

The greatest common divisor of a and b is obtained with the command `gcd(a, b)`, where in our first uses, a and b are integers. Later, a and b can be other objects with a notion of divisibility and “greatness,” such as polynomials. For example,

```
gcd(2776, 2452)
```

4

We can use the `gcd` command to determine if a pair of integers are relatively prime.

```
a = 31049
b = 2105
gcd(a, b) == 1
```

True

```
a = 3563
b = 2947
gcd(a, b) == 1
```

False

The command `xgcd(a,b)` (“eXtended GCD”) returns a triple where the first element is the greatest common divisor of a and b (as with the `gcd(a,b)` command above), but the next two elements are values of r and s such that $ra + sb = \text{gcd}(a, b)$.

```
xgcd(633, 331)
```

(1, -137, 262)

Portions of the triple can be extracted using `[]` (“indexing”) to access the entries of the triple, starting with the first as number 0. For example, the following should always return the result `True`, even if you change the values of a and b . Try changing the values of a and b below, to see that the result is always `True`.

```
a = 633
b = 331
extended = xgcd(a, b)
g = extended[0]
r = extended[1]
s = extended[2]
g == r*a + s*b
```

True

Studying this block of code will go a long way towards helping you get the most out of Sage’s output. Note that `=` is how a value is *assigned* to a variable, while as in the last line, `==` is how we compare two items for *equality*.

2.3.3 Primes and Factoring

The method `.is_prime()` will determine if an integer is prime or not.

```
a = 117371
a.is_prime()
```

True

```
b = 14547073
b.is_prime()
```

False

```
b == 1597 * 9109
```

True

The command `random_prime(a, proof=True)` will generate a random prime number between 2 and a . Experiment by executing the following two compute cells several times. (Replacing `proof=True` by `proof=False` will speed up the search, but there will be a very, very, very small probability the result will not be prime.)

```
a = random_prime(10^21, proof=True)
a
```

```
424729101793542195193
```

```
a.is_prime()
```

True

The command `prime_range(a, b)` returns an ordered list of all the primes from a to $b - 1$, inclusive. For example,

```
prime_range(500, 550)
```

```
[503, 509, 521, 523, 541, 547]
```

The commands `next_prime(a)` and `previous_prime(a)` are other ways to get a single prime number of a desired size. Give them a try below if you have an empty compute cell there (as you will if you are reading in the Sage Notebook, or are reading the online version). (The hash symbol, #, is used to indicate a “comment” line, which will not be evaluated by Sage. So erase this line, or start on the one below it.) In addition to checking if integers are prime or not, or generating prime numbers, Sage can also decompose any integer into its prime factors, as described by the Fundamental Theorem of Arithmetic ([Theorem 2.2.7](#)).

```
a = 2600
a.factor()
```

```
2^3 * 5^2 * 13
```

So $2600 = 2^3 \times 5^2 \times 13$ and this is the unique way to write 2600 as a product of prime numbers (other than rearranging the order of the primes themselves in the product).

While Sage will print a factorization nicely, it is carried internally as a list of pairs of integers, with each pair being a base (a prime number) and an exponent (a positive integer). Study the following carefully, as it is another good exercise in working with Sage output in the form of lists.

```
a = 2600
factored = a.factor()
first_term = factored[0]
first_term
```

(2, 3)

```
second_term = factored[1]
second_term
```

(5, 2)

```
third_term = factored[2]
third_term
```

(13, 1)

```
first_prime = first_term[0]
first_prime
```

2

```
first_exponent = first_term[1]
first_exponent
```

3

The next compute cell reveals the internal version of the factorization by asking for the actual list. And we show how you could determine exactly how many terms the factorization has by using the length command, `len()`.

```
list(factored)
```

[(2, 3), (5, 2), (13, 1)]

```
len(factored)
```

3

Can you extract the next two primes, and their exponents, from `a`?

2.4 Exercises

1. Prove that

$$1^2 + 2^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}$$

for $n \in \mathbb{N}$.

Answer. The base case, $S(1) : [1(1+1)(2(1)+1)]/6 = 1 = 1^2$ is true.

Assume that $S(k) : 1^2 + 2^2 + \cdots + k^2 = [k(k+1)(2k+1)]/6$ is true. Then

$$\begin{aligned} 1^2 + 2^2 + \cdots + k^2 + (k+1)^2 &= [k(k+1)(2k+1)]/6 + (k+1)^2 \\ &= [(k+1)((k+1)+1)(2(k+1)+1)]/6, \end{aligned}$$

and so $S(k+1)$ is true. Thus, $S(n)$ is true for all positive integers n .

2. Prove that

$$1^3 + 2^3 + \cdots + n^3 = \frac{n^2(n+1)^2}{4}$$

for $n \in \mathbb{N}$.

3. Prove that $n! > 2^n$ for $n \geq 4$.

Answer. The base case, $S(4) : 4! = 24 > 16 = 2^4$ is true. Assume

$S(k) : k! > 2^k$ is true. Then $(k+1)! = k!(k+1) > 2^k \cdot 2 = 2^{k+1}$, so $S(k+1)$ is true. Thus, $S(n)$ is true for all positive integers n .

4. Prove that

$$x + 4x + 7x + \cdots + (3n-2)x = \frac{n(3n-1)x}{2}$$

for $n \in \mathbb{N}$.

5. Prove that $10^{n+1} + 10^n + 1$ is divisible by 3 for $n \in \mathbb{N}$.
 6. Prove that $4 \cdot 10^{2n} + 9 \cdot 10^{2n-1} + 5$ is divisible by 99 for $n \in \mathbb{N}$.
 7. Show that

$$\sqrt[n]{a_1 a_2 \cdots a_n} \leq \frac{1}{n} \sum_{k=1}^n a_k.$$

8. Prove the Leibniz rule for $f^{(n)}(x)$, where $f^{(n)}$ is the n th derivative of f ; that is, show that

$$(fg)^{(n)}(x) = \sum_{k=0}^n \binom{n}{k} f^{(k)}(x) g^{(n-k)}(x).$$

Hint. Follow the proof in [Example 2.1.4](#).

9. Use induction to prove that $1 + 2 + 2^2 + \cdots + 2^n = 2^{n+1} - 1$ for $n \in \mathbb{N}$.
 10. Prove that

$$\frac{1}{2} + \frac{1}{6} + \cdots + \frac{1}{n(n+1)} = \frac{n}{n+1}$$

for $n \in \mathbb{N}$.

11. If x is a nonnegative real number, then show that $(1+x)^n - 1 \geq nx$ for $n = 0, 1, 2, \dots$

Hint. The base case, $S(0) : (1+x)^0 - 1 = 0 \geq 0 = 0 \cdot x$ is true. Assume $S(k) : (1+x)^k - 1 \geq kx$ is true. Then

$$\begin{aligned} (1+x)^{k+1} - 1 &= (1+x)(1+x)^k - 1 \\ &= (1+x)^k + x(1+x)^k - 1 \\ &\geq kx + x(1+x)^k \\ &\geq kx + x \\ &= (k+1)x, \end{aligned}$$

so $S(k+1)$ is true. Therefore, $S(n)$ is true for all positive integers n .

12. **Power Sets.** Let X be a set. Define the **power set** of X , denoted $\mathcal{P}(X)$, to be the set of all subsets of X . For example,

$$\mathcal{P}(\{a, b\}) = \{\emptyset, \{a\}, \{b\}, \{a, b\}\}.$$

For every positive integer n , show that a set with exactly n elements has a power set with exactly 2^n elements.

13. Prove that the two principles of mathematical induction stated in [Section 2.1](#) are equivalent.
 14. Show that the Principle of Well-Ordering for the natural numbers implies that 1 is the smallest natural number. Use this result to show that the Principle of Well-Ordering implies the Principle of Mathematical Induction; that is, show that if $S \subset \mathbb{N}$ such that $1 \in S$ and $n+1 \in S$ whenever

$n \in S$, then $S = \mathbb{N}$.

15. For each of the following pairs of numbers a and b , calculate $\gcd(a, b)$ and find integers r and s such that $\gcd(a, b) = ra + sb$.
- (a) 14 and 39 (d) 471 and 562
 (b) 234 and 165 (e) 23,771 and 19,945
 (c) 1739 and 9923 (f) -4357 and 3754
16. Let a and b be nonzero integers. If there exist integers r and s such that $ar + bs = 1$, show that a and b are relatively prime.
17. **Fibonacci Numbers.** The Fibonacci numbers are

$$1, 1, 2, 3, 5, 8, 13, 21, \dots$$

We can define them inductively by $f_1 = 1$, $f_2 = 1$, and $f_{n+2} = f_{n+1} + f_n$ for $n \in \mathbb{N}$.

- (a) Prove that $f_n < 2^n$.
 (b) Prove that $f_{n+1}f_{n-1} = f_n^2 + (-1)^n$, $n \geq 2$.
 (c) Prove that $f_n = [(1 + \sqrt{5})^n - (1 - \sqrt{5})^n] / 2^n \sqrt{5}$.
 (d) Show that $\lim_{n \rightarrow \infty} f_n / f_{n+1} = (\sqrt{5} - 1) / 2$.
 (e) Prove that f_n and f_{n+1} are relatively prime.

Hint. For [Item 2.4.17.a](#) and [Item 2.4.17.b](#) use mathematical induction. [Item 2.4.17.c](#) Show that $f_1 = 1$, $f_2 = 1$, and $f_{n+2} = f_{n+1} + f_n$. [Item 2.4.17.d](#) Use part [Item 2.4.17.c](#). [Item 2.4.17.e](#) Use part [Item 2.4.17.b](#) and [Exercise 2.4.16](#).

18. Let a and b be integers such that $\gcd(a, b) = 1$. Let r and s be integers such that $ar + bs = 1$. Prove that
- $$\gcd(a, s) = \gcd(r, b) = \gcd(r, s) = 1.$$
19. Let $x, y \in \mathbb{N}$ be relatively prime. If xy is a perfect square, prove that x and y must both be perfect squares.
- Hint.** Use the Fundamental Theorem of Arithmetic.
20. Using the division algorithm, show that every perfect square is of the form $4k$ or $4k + 1$ for some nonnegative integer k .
21. Suppose that a, b, r, s are pairwise relatively prime and that

$$\begin{aligned} a^2 + b^2 &= r^2 \\ a^2 - b^2 &= s^2. \end{aligned}$$

Prove that a , r , and s are odd and b is even.

22. Let $n \in \mathbb{N}$. Use the division algorithm to prove that every integer is congruent mod n to precisely one of the integers $0, 1, \dots, n - 1$. Conclude that if r is an integer, then there is exactly one s in \mathbb{Z} such that $0 \leq s < n$ and $[r] = [s]$. Hence, the integers are indeed partitioned by congruence mod n .
23. Define the **least common multiple** of two nonzero integers a and b , denoted by $\text{lcm}(a, b)$, to be the nonnegative integer m such that both a and b divide m , and if a and b divide any other integer n , then m also

divides n . Prove that any two integers a and b have a unique least common multiple.

Hint. Let $S = \{s \in \mathbb{N} : a \mid s, b \mid s\}$. Then $S \neq \emptyset$, since $|ab| \in S$. By the Principle of Well-Ordering, S contains a least element m . To show uniqueness, suppose that $a \mid n$ and $b \mid n$ for some $n \in \mathbb{N}$. By the division algorithm, there exist unique integers q and r such that $n = mq + r$, where $0 \leq r < m$. Since a and b divide both m , and n , it must be the case that a and b both divide r . Thus, $r = 0$ by the minimality of m . Therefore, $m \mid n$.

24. If $d = \gcd(a, b)$ and $m = \text{lcm}(a, b)$, prove that $dm = |ab|$.
25. Show that $\text{lcm}(a, b) = ab$ if and only if $\gcd(a, b) = 1$.
26. Prove that $\gcd(a, c) = \gcd(b, c) = 1$ if and only if $\gcd(ab, c) = 1$ for integers a , b , and c .
27. Let $a, b, c \in \mathbb{Z}$. Prove that if $\gcd(a, b) = 1$ and $a \mid bc$, then $a \mid c$.
- Hint.** Since $\gcd(a, b) = 1$, there exist integers r and s such that $ar + bs = 1$. Thus, $acr + bcs = c$. Since a divides both bc and itself, a must divide c .
28. Let $p \geq 2$. Prove that if $2^p - 1$ is prime, then p must also be prime.
29. Prove that there are an infinite number of primes of the form $6n + 5$.
- Hint.** Every prime must be of the form 2 , 3 , $6n + 1$, or $6n + 5$. Suppose there are only finitely many primes of the form $6k + 5$.
30. Prove that there are an infinite number of primes of the form $4n - 1$.
31. Using the fact that 2 is prime, show that there do not exist integers p and q such that $p^2 = 2q^2$. Demonstrate that therefore $\sqrt{2}$ cannot be a rational number.

2.5 Programming Exercises

1. **The Sieve of Eratosthenes.** One method of computing all of the prime numbers less than a certain fixed positive integer N is to list all of the numbers n such that $1 < n < N$. Begin by eliminating all of the multiples of 2 . Next eliminate all of the multiples of 3 . Now eliminate all of the multiples of 5 . Notice that 4 has already been crossed out. Continue in this manner, noticing that we do not have to go all the way to N ; it suffices to stop at \sqrt{N} . Using this method, compute all of the prime numbers less than $N = 250$. We can also use this method to find all of the integers that are relatively prime to an integer N . Simply eliminate the prime factors of N and all of their multiples. Using this method, find all of the numbers that are relatively prime to $N = 120$. Using the Sieve of Eratosthenes, write a program that will compute all of the primes less than an integer N .
2. Let $\mathbb{N}^0 = \mathbb{N} \cup \{0\}$. Ackermann's function is the function $A : \mathbb{N}^0 \times \mathbb{N}^0 \rightarrow \mathbb{N}^0$ defined by the equations

$$\begin{aligned} A(0, y) &= y + 1, \\ A(x + 1, 0) &= A(x, 1), \\ A(x + 1, y + 1) &= A(x, A(x + 1, y)). \end{aligned}$$

Use this definition to compute $A(3, 1)$. Write a program to evaluate Ackermann's function. Modify the program to count the number of statements

executed in the program when Ackermann's function is evaluated. How many statements are executed in the evaluation of $A(4, 1)$? What about $A(5, 1)$?

3. Write a computer program that will implement the Euclidean algorithm. The program should accept two positive integers a and b as input and should output $\gcd(a, b)$ as well as integers r and s such that

$$\gcd(a, b) = ra + sb.$$

2.6 Sage Exercises

These exercises are about investigating basic properties of the integers, something we will frequently do when investigating groups. Use the editing capabilities of a Sage worksheet to annotate and explain your work.

1. Use the `next_prime()` command to construct two different 8-digit prime numbers and save them in variables named `a` and `b`.
2. Use the `.is_prime()` method to verify that your primes `a` and `b` are really prime.
3. Verify that 1 is the greatest common divisor of your two primes from the previous exercises.
4. Find two integers that make a "linear combination" of your two primes equal to 1. Include a verification of your result.
5. Determine a factorization into powers of primes for $c = 4\,598\,037\,234$.
6. Write a compute cell that defines the same value of `c` again, and then defines a candidate divisor of `c` named `d`. The third line of the cell should return `True` if and only if `d` is a divisor of `c`. Illustrate the use of your cell by testing your code with $d = 7$ and in a new copy of the cell, testing your code with $d = 11$.

Chapter 3

Groups

David Farmer

We begin our study of algebraic structures by investigating sets associated with single operations that satisfy certain reasonable axioms; that is, we want to define an operation on a set in a way that will generalize such familiar structures as the integers \mathbb{Z} together with the single operation of addition, or invertible 2×2 matrices together with the single operation of matrix multiplication. The integers and the 2×2 matrices, together with their respective single operations, are examples of algebraic structures known as groups.

The theory of groups occupies a central position in mathematics. Modern group theory arose from an attempt to find the roots of a polynomial in terms of its coefficients. Groups now play a central role in such areas as coding theory, counting, and the study of symmetries; many areas of biology, chemistry, and physics have benefited from group theory.

Alex Jordan helped improve this chapter.

3.1 Integer Equivalence Classes and Symmetries

Carl Friedrich Gauß, Leonhard Euler

Let us now investigate some mathematical structures that can be viewed as sets with single operations.

3.1.1 The Integers mod n

Gottfried Wilhelm Leibniz

The integers mod n have become indispensable in the theory and applications of algebra. In mathematics they are used in cryptography, coding theory, and the detection of errors in identification codes.

We have already seen that two integers a and b are equivalent mod n if n divides $a - b$. The integers mod n also partition \mathbb{Z} into n different equivalence classes; we will denote the set of these equivalence classes by \mathbb{Z}_n . Consider the integers modulo 12 and the corresponding partition of the integers:

$$\begin{aligned}[0] &= \{\dots, -12, 0, 12, 24, \dots\}, \\ [1] &= \{\dots, -11, 1, 13, 25, \dots\},\end{aligned}$$

$$\begin{aligned} & \vdots \\ [11] &= \{\dots, -1, 11, 23, 35, \dots\}. \end{aligned}$$

When no confusion can arise, we will use $0, 1, \dots, 11$ to indicate the equivalence classes $[0], [1], \dots, [11]$ respectively. We can do arithmetic on \mathbb{Z}_n . For two integers a and b , define addition modulo n to be $(a + b) \pmod{n}$; that is, the remainder when $a + b$ is divided by n . Similarly, multiplication modulo n is defined as $(ab) \pmod{n}$, the remainder when ab is divided by n .

Example 3.1.1 Modular Addition. The following examples illustrate integer arithmetic modulo n :

$$\begin{array}{ll} 7 + 4 \equiv 1 \pmod{5} & 7 \cdot 3 \equiv 1 \pmod{5} \\ 3 + 5 \equiv 0 \pmod{8} & 3 \cdot 5 \equiv 7 \pmod{8} \\ 3 + 4 \equiv 7 \pmod{12} & 3 \cdot 4 \equiv 0 \pmod{12}. \end{array}$$

In particular, notice that it is possible that the product of two nonzero numbers modulo n can be equivalent to 0 modulo n . \square

Example 3.1.2 Modular Arithmetic. Most, but not all, of the usual laws of arithmetic hold for addition and multiplication in \mathbb{Z}_n . For instance, it is not necessarily true that there is a multiplicative inverse. Consider the multiplication table for \mathbb{Z}_8 in Figure 3.1.3. Notice that 2, 4, and 6 do not have multiplicative inverses; that is, for $n = 2, 4$, or 6 , there is no integer k such that $kn \equiv 1 \pmod{8}$.

\cdot	0	1	2	3	4	5	6	7
0	0	0	0	0	0	0	0	0
1	0	1	2	3	4	5	6	7
2	0	2	4	6	0	2	4	6
3	0	3	6	1	4	7	2	5
4	0	4	0	4	0	4	0	4
5	0	5	2	7	4	1	6	3
6	0	6	4	2	0	6	4	2
7	0	7	6	5	4	3	2	1

Figure 3.1.3: Multiplication table for \mathbb{Z}_8

\square

Proposition 3.1.4 Let \mathbb{Z}_n be the set of equivalence classes of the integers mod n and $a, b, c \in \mathbb{Z}_n$.

1. Addition and multiplication are commutative:

$$\begin{aligned} a + b &\equiv b + a \pmod{n} \\ ab &\equiv ba \pmod{n}. \end{aligned}$$

2. Addition and multiplication are associative:

$$\begin{aligned} (a + b) + c &\equiv a + (b + c) \pmod{n} \\ (ab)c &\equiv a(bc) \pmod{n}. \end{aligned}$$

3. There are both additive and multiplicative identities:

$$a + 0 \equiv a \pmod{n}$$

$$a \cdot 1 \equiv a \pmod{n}.$$

4. *Multiplication distributes over addition:*

$$a(b + c) \equiv ab + ac \pmod{n}.$$

5. *For every integer a there is an additive inverse $-a$:*

$$a + (-a) \equiv 0 \pmod{n}.$$

6. *Let a be a nonzero integer. Then $\gcd(a, n) = 1$ if and only if there exists a multiplicative inverse b for $a \pmod{n}$; that is, a nonzero integer b such that*

$$ab \equiv 1 \pmod{n}.$$

Proof. We will prove (1) and (6) and leave the remaining properties to be proven in the exercises.

(1) Addition and multiplication are commutative modulo n since the remainder of $a + b$ divided by n is the same as the remainder of $b + a$ divided by n .

(6) Suppose that $\gcd(a, n) = 1$. Then there exist integers r and s such that $ar + ns = 1$. Since $ns = 1 - ar$, it must be the case that $ar \equiv 1 \pmod{n}$. Letting b be the equivalence class of r , $ab \equiv 1 \pmod{n}$.

Conversely, suppose that there exists an integer b such that $ab \equiv 1 \pmod{n}$. Then n divides $ab - 1$, so there is an integer k such that $ab - nk = 1$. Let $d = \gcd(a, n)$. Since d divides $ab - nk$, d must also divide 1; hence, $d = 1$. ■

3.1.2 Symmetries

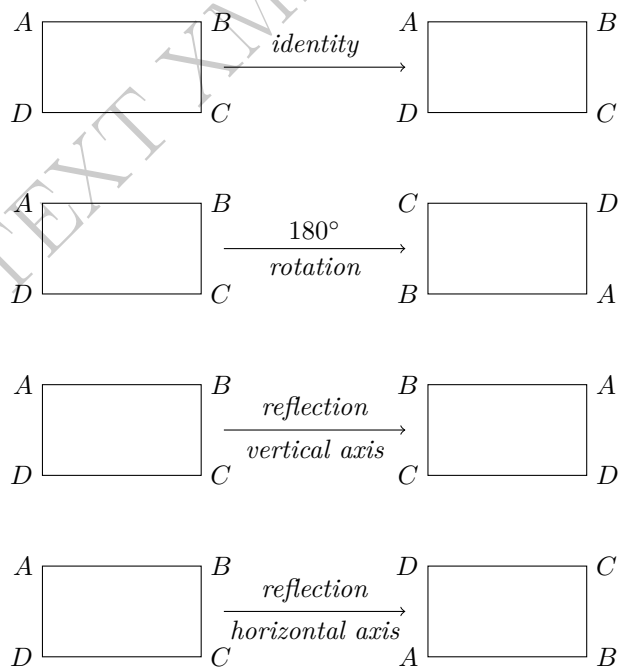

Figure 3.1.5: Rigid motions of a rectangle

A **symmetry** of a geometric figure is a rearrangement of the figure preserving the arrangement of its sides and vertices as well as its distances and angles. A map from the plane to itself preserving the symmetry of an object is called a **rigid motion**. For example, if we look at the rectangle in Figure 3.1.5, it is easy to see that a rotation of 180° or 360° returns a rectangle in the plane with the same orientation as the original rectangle and the same relationship among the vertices. A reflection of the rectangle across either the vertical axis or the horizontal axis can also be seen to be a symmetry. However, a 90° rotation in either direction cannot be a symmetry unless the rectangle is a square.

Figure 3.1.6: Symmetries of a triangle

Let us find the symmetries of the equilateral triangle $\triangle ABC$. To find a symmetry of $\triangle ABC$, we must first examine the permutations of the vertices A , B , and C and then ask if a permutation extends to a symmetry of the triangle. Recall that a **permutation** of a set S is a one-to-one and onto map $\pi : S \rightarrow S$. The three vertices have $3! = 6$ permutations, so the triangle has at most six symmetries. To see that there are six permutations, observe there are three different possibilities for the first vertex, and two for the second, and the remaining vertex is determined by the placement of the first two. So we have $3 \cdot 2 \cdot 1 = 3! = 6$ different arrangements. To denote the permutation of the vertices of an equilateral triangle that sends A to B , B to C , and C to A ,

we write the array

$$\begin{pmatrix} A & B & C \\ B & C & A \end{pmatrix}.$$

Notice that this particular permutation corresponds to the rigid motion of rotating the triangle by 120° in a clockwise direction. In fact, every permutation gives rise to a symmetry of the triangle. All of these symmetries are shown in [Figure 3.1.6](#).

A natural question to ask is what happens if one motion of the triangle $\triangle ABC$ is followed by another. Which symmetry is $\mu_1\rho_1$; that is, what happens when we do the permutation ρ_1 and then the permutation μ_1 ? *Remember that we are composing functions here. Although we usually multiply left to right, we compose functions right to left.* We have

$$\begin{aligned} (\mu_1\rho_1)(A) &= \mu_1(\rho_1(A)) = \mu_1(B) = C \\ (\mu_1\rho_1)(B) &= \mu_1(\rho_1(B)) = \mu_1(C) = B \\ (\mu_1\rho_1)(C) &= \mu_1(\rho_1(C)) = \mu_1(A) = A. \end{aligned}$$

This is the same symmetry as μ_2 . Suppose we do these motions in the opposite order, ρ_1 then μ_1 . It is easy to determine that this is the same as the symmetry μ_3 ; hence, $\rho_1\mu_1 \neq \mu_1\rho_1$. A multiplication table for the symmetries of an equilateral triangle $\triangle ABC$ is given in [Figure 3.1.7](#).

Notice that in the multiplication table for the symmetries of an equilateral triangle, for every motion of the triangle α there is another motion β such that $\alpha\beta = id$; that is, for every motion there is another motion that takes the triangle back to its original orientation.

\circ	id	ρ_1	ρ_2	μ_1	μ_2	μ_3
id	id	ρ_1	ρ_2	μ_1	μ_2	μ_3
ρ_1	ρ_1	ρ_2	id	μ_3	μ_1	μ_2
ρ_2	ρ_2	id	ρ_1	μ_2	μ_3	μ_1
μ_1	μ_1	μ_2	μ_3	id	ρ_1	ρ_2
μ_2	μ_2	μ_3	μ_1	ρ_2	id	ρ_1
μ_3	μ_3	μ_1	μ_2	ρ_1	ρ_2	id

Figure 3.1.7: Symmetries of an equilateral triangle

3.2 Definitions and Examples

3.2.1 Definition of a Group

The integers mod n and the symmetries of a triangle or a rectangle are examples of groups. A **binary operation** or **law of composition** on a set G is a function $G \times G \rightarrow G$ that assigns to each pair $(a, b) \in G \times G$ a unique element $a \circ b$, or ab in G , called the composition of a and b . A **group** (G, \circ) is a set G together with a law of composition $(a, b) \mapsto a \circ b$ that satisfies the following axioms.

- The law of composition is **associative**. That is,

$$(a \circ b) \circ c = a \circ (b \circ c)$$

for $a, b, c \in G$.

- There exists an element $e \in G$, called the **identity element**, such that for any element $a \in G$

$$e \circ a = a \circ e = a.$$

- For each element $a \in G$, there exists an **inverse element** in G , denoted by a^{-1} , such that

$$a \circ a^{-1} = a^{-1} \circ a = e.$$

A group G with the property that $a \circ b = b \circ a$ for all $a, b \in G$ is called **abelian** or **commutative**. Groups not satisfying this property are said to be **nonabelian** or **noncommutative**.

3.2.2 Examples of Groups

Example 3.2.1 Group of All Integers. The integers $\mathbb{Z} = \{\dots, -1, 0, 1, 2, \dots\}$ form a group under the operation of addition. The binary operation on two integers $m, n \in \mathbb{Z}$ is just their sum. Since the integers under addition already have a well-established notation, we will use the operator $+$ instead of \circ ; that is, we shall write $m + n$ instead of $m \circ n$. The identity is 0, and the inverse of $n \in \mathbb{Z}$ is written as $-n$ instead of n^{-1} . Notice that the set of integers under addition have the additional property that $m + n = n + m$ and therefore form an abelian group. \square

Most of the time we will write ab instead of $a \circ b$; however, if the group already has a natural operation such as addition in the integers, we will use that operation. That is, if we are adding two integers, we still write $m + n$, $-n$ for the inverse, and 0 for the identity as usual. We also write $m - n$ instead of $m + (-n)$.

It is often convenient to describe a group in terms of an addition or multiplication table. Such a table is called a **Cayley table**.

Example 3.2.2 Group of Integers Modulo 5. The integers mod n form a group under addition modulo n . Consider \mathbb{Z}_5 , consisting of the equivalence classes of the integers 0, 1, 2, 3, and 4. We define the group operation on \mathbb{Z}_5 by modular addition. We write the binary operation on the group additively; that is, we write $m + n$. The element 0 is the identity of the group and each element in \mathbb{Z}_5 has an inverse. For instance, $2 + 3 = 3 + 2 = 0$. **Figure 3.2.3** is a Cayley table for \mathbb{Z}_5 (Contributed by [Robert Beezer](#)). By **Proposition 3.1.4**, $\mathbb{Z}_n = \{0, 1, \dots, n - 1\}$ is a group under the binary operation of addition mod n .

+	0	1	2	3	4
0	0	1	2	3	4
1	1	2	3	4	0
2	2	3	4	0	1
3	3	4	0	1	2
4	4	0	1	2	3

Figure 3.2.3: Cayley table for $(\mathbb{Z}_5, +)$

\square

Example 3.2.4 Multiplication of Integers Modulo 6. Not every set with a binary operation is a group. For example, if we let modular multiplication be the binary operation on \mathbb{Z}_n , then \mathbb{Z}_n fails to be a group. The element 1 acts as a group identity since $1 \cdot k = k \cdot 1 = k$ for any $k \in \mathbb{Z}_n$; however, a multiplicative

inverse for 0 does not exist since $0 \cdot k = k \cdot 0 = 0$ for every k in \mathbb{Z}_n . Even if we consider the set $\mathbb{Z}_n \setminus \{0\}$, we still may not have a group. For instance, let $2 \in \mathbb{Z}_6$. Then 2 has no multiplicative inverse since

$$\begin{aligned} 0 \cdot 2 &= 0 & 1 \cdot 2 &= 2 \\ 2 \cdot 2 &= 4 & 3 \cdot 2 &= 0 \\ 4 \cdot 2 &= 2 & 5 \cdot 2 &= 4. \end{aligned}$$

By [Proposition 3.1.4](#), every nonzero k does have an inverse in \mathbb{Z}_n if k is relatively prime to n . Denote the set of all such nonzero elements in \mathbb{Z}_n by $U(n)$. Then $U(n)$ is a group called the **group of units** of \mathbb{Z}_n . [Figure 3.2.5](#) is a Cayley table for the group $U(8)$.

\cdot	1	3	5	7
1	1	3	5	7
3	3	1	7	5
5	5	7	1	3
7	7	5	3	1

Figure 3.2.5: Multiplication table for $U(8)$

□

Example 3.2.6 Symmetries of a Triangle is not Abelian. The symmetries of an equilateral triangle described in [Section 3.1](#) form a nonabelian group. As we observed, it is not necessarily true that $\alpha\beta = \beta\alpha$ for two symmetries α and β . Using [Figure 3.1.7](#), which is a Cayley table for this group, we can easily check that the symmetries of an equilateral triangle are indeed a group. We will denote this group by either S_3 or D_3 , for reasons that will be explained later. □

Example 3.2.7 Matrix Multiplication of 2×2 Matrices is a Group. We use $\mathbb{M}_2(\mathbb{R})$ to denote the set of all 2×2 matrices. Let $GL_2(\mathbb{R})$ be the subset of $\mathbb{M}_2(\mathbb{R})$ consisting of invertible matrices; that is, a matrix

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

is in $GL_2(\mathbb{R})$ if there exists a matrix A^{-1} such that $AA^{-1} = A^{-1}A = I$, where I is the 2×2 identity matrix. For A to have an inverse is equivalent to requiring that the determinant of A be nonzero; that is, $\det A = ad - bc \neq 0$. The set of invertible matrices forms a group called the **general linear group**. The identity of the group is the identity matrix

$$I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}.$$

The inverse of $A \in GL_2(\mathbb{R})$ is

$$A^{-1} = \frac{1}{ad - bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}.$$

The product of two invertible matrices is again invertible. Matrix multiplication is associative, satisfying the other group axiom. For matrices it is not true in general that $AB = BA$; hence, $GL_2(\mathbb{R})$ is another example of a nonabelian group. □

Example 3.2.8 Group of Quaternions. Let

$$\begin{aligned} 1 &= \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} & I &= \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \\ J &= \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix} & K &= \begin{pmatrix} i & 0 \\ 0 & -i \end{pmatrix}, \end{aligned}$$

where $i^2 = -1$. Then the relations $I^2 = J^2 = K^2 = -1$, $IJ = K$, $JK = I$, $KI = J$, $JI = -K$, $KJ = -I$, and $IK = -J$ hold. The set $Q_8 = \{\pm 1, \pm I, \pm J, \pm K\}$ is a group called the **quaternion group**. Notice that Q_8 is noncommutative. \square

Example 3.2.9 Group of Nonzero Complex Numbers. Let \mathbb{C}^* be the set of nonzero complex numbers. Under the operation of multiplication \mathbb{C}^* forms a group. The identity is 1. If $z = a + bi$ is a nonzero complex number, then

$$z^{-1} = \frac{a - bi}{a^2 + b^2}$$

is the inverse of z . It is easy to see that the remaining group axioms hold. \square

A group is **finite**, or has **finite order**, if it contains a finite number of elements; otherwise, the group is said to be **infinite** or to have **infinite order**. The **order** of a finite group is the number of elements that it contains. If G is a group containing n elements, we write $|G| = n$. The group \mathbb{Z}_5 is a finite group of order 5; the integers \mathbb{Z} form an infinite group under addition, and we sometimes write $|\mathbb{Z}| = \infty$.

3.2.3 Basic Properties of Groups

Proposition 3.2.10 *The identity element in a group G is unique; that is, there exists only one element $e \in G$ such that $eg = ge = g$ for all $g \in G$.*

Proof. Suppose that e and e' are both identities in G . Then $eg = ge = g$ and $e'g = ge' = g$ for all $g \in G$. We need to show that $e = e'$. If we think of e as the identity, then $ee' = e'$; but if e' is the identity, then $ee' = e$. Combining these two equations, we have $e = ee' = e'$. (David Farmer helped with this proof.) \blacksquare

Inverses in a group are also unique. If g' and g'' are both inverses of an element g in a group G , then $gg' = g'g = e$ and $gg'' = g''g = e$. We want to show that $g' = g''$, but $g' = g'e = g'(gg'') = (g'g)g'' = eg'' = g''$. We summarize this fact in the following proposition.

Proposition 3.2.11 *If g is any element in a group G , then the inverse of g , denoted by g^{-1} , is unique.*

Proposition 3.2.12 *Let G be a group. If $a, b \in G$, then $(ab)^{-1} = b^{-1}a^{-1}$.*

Proof. Let $a, b \in G$. Then $abb^{-1}a^{-1} = aea^{-1} = aa^{-1} = e$. Similarly, $b^{-1}a^{-1}ab = e$. But by the previous proposition, inverses are unique; hence, $(ab)^{-1} = b^{-1}a^{-1}$. \blacksquare

Proposition 3.2.13 *Let G be a group. For any $a \in G$, $(a^{-1})^{-1} = a$.*

Proof. Observe that $a^{-1}(a^{-1})^{-1} = e$. Consequently, multiplying both sides of this equation by a , we have

$$(a^{-1})^{-1} = e(a^{-1})^{-1} = aa^{-1}(a^{-1})^{-1} = ae = a. \quad \blacksquare$$

It makes sense to write equations with group elements and group operations. If a and b are two elements in a group G , does there exist an element $x \in G$ such that $ax = b$? If such an x does exist, is it unique? The following proposition answers both of these questions positively.

Proposition 3.2.14 *Let G be a group and a and b be any two elements in G . Then the equations $ax = b$ and $xa = b$ have unique solutions in G .*

Proof. Suppose that $ax = b$. We must show that such an x exists. Multiplying both sides of $ax = b$ by a^{-1} , we have $x = ex = a^{-1}ax = a^{-1}b$.

To show uniqueness, suppose that x_1 and x_2 are both solutions of $ax = b$; then $ax_1 = b = ax_2$. So $x_1 = a^{-1}ax_1 = a^{-1}ax_2 = x_2$. The proof for the existence and uniqueness of the solution of $xa = b$ is similar. \blacksquare

Proposition 3.2.15 *If G is a group and $a, b, c \in G$, then $ba = ca$ implies $b = c$ and $ab = ac$ implies $b = c$.*

This proposition tells us that the **right and left cancellation laws** are true in groups. We leave the proof as an exercise.

We can use exponential notation for groups just as we do in ordinary algebra. If G is a group and $g \in G$, then we define $g^0 = e$. For $n \in \mathbb{N}$, we define

$$g^n = \underbrace{g \cdot g \cdots g}_{n \text{ times}}$$

and

$$g^{-n} = \underbrace{g^{-1} \cdot g^{-1} \cdots g^{-1}}_{n \text{ times}}.$$

Theorem 3.2.16 *In a group, the usual laws of exponents hold; that is, for all $g, h \in G$,*

1. $g^m g^n = g^{m+n}$ for all $m, n \in \mathbb{Z}$;
2. $(g^m)^n = g^{mn}$ for all $m, n \in \mathbb{Z}$;
3. $(gh)^n = (h^{-1}g^{-1})^{-n}$ for all $n \in \mathbb{Z}$. Furthermore, if G is abelian, then $(gh)^n = g^n h^n$.

We will leave the proof of this theorem as an exercise. Notice that $(gh)^n \neq g^n h^n$ in general, since the group may not be abelian. If the group is \mathbb{Z} or \mathbb{Z}_n , we write the group operation additively and the exponential operation multiplicatively; that is, we write ng instead of g^n . The laws of exponents now become

1. $mg + ng = (m + n)g$ for all $m, n \in \mathbb{Z}$;
2. $m(ng) = (mn)g$ for all $m, n \in \mathbb{Z}$;
3. $m(g + h) = mg + mh$ for all $n \in \mathbb{Z}$.

It is important to realize that the last statement can be made only because \mathbb{Z} and \mathbb{Z}_n are commutative groups.

3.2.4 Historical Note

Although the first clear axiomatic definition of a group was not given until the late 1800s, group-theoretic methods had been employed before this time in the development of many areas of mathematics, including geometry and the theory of algebraic equations.

Joseph-Louis Lagrange used group-theoretic methods in a 1770–1771 memoir to study methods of solving polynomial equations. Later, Évariste Galois (1811–1832) succeeded in developing the mathematics necessary to determine exactly which polynomial equations could be solved in terms of the polynomial coefficients. Galois' primary tool was group theory.

The study of geometry was revolutionized in 1872 when Felix Klein proposed that geometric spaces should be studied by examining those properties that are invariant under a transformation of the space. Sophus Lie, a contemporary of Klein, used group theory to study solutions of partial differential equations. One of the first modern treatments of group theory appeared in William Burnside's *The Theory of Groups of Finite Order* [1], first published in 1897.

3.3 Subgroups

3.3.1 Definitions and Examples

Sometimes we wish to investigate smaller groups sitting inside a larger group. The set of even integers $2\mathbb{Z} = \{\dots, -2, 0, 2, 4, \dots\}$ is a group under the operation of addition. This smaller group sits naturally inside of the group of integers under addition. We define a **subgroup** H of a group G to be a subset H of G such that when the group operation of G is restricted to H , H is a group in its own right. Observe that every group G with at least two elements will always have at least two subgroups, the subgroup consisting of the identity element alone and the entire group itself. The subgroup $H = \{e\}$ of a group G is called the **trivial subgroup**. A subgroup that is a proper subset of G is called a **proper subgroup**. In many of the examples that we have investigated up to this point, there exist other subgroups besides the trivial and improper subgroups.

Example 3.3.1 A Subgroup of the Reals. Consider the set of nonzero real numbers, \mathbb{R}^* , with the group operation of multiplication. The identity of this group is 1 and the inverse of any element $a \in \mathbb{R}^*$ is just $1/a$. We will show that

$$\mathbb{Q}^* = \{p/q : p \text{ and } q \text{ are nonzero integers}\}$$

is a subgroup of \mathbb{R}^* . The identity of \mathbb{R}^* is 1; however, $1 = 1/1$ is the quotient of two nonzero integers. Hence, the identity of \mathbb{R}^* is in \mathbb{Q}^* . Given two elements in \mathbb{Q}^* , say p/q and r/s , their product pr/qs is also in \mathbb{Q}^* . The inverse of any element $p/q \in \mathbb{Q}^*$ is again in \mathbb{Q}^* since $(p/q)^{-1} = q/p$. Since multiplication in \mathbb{R}^* is associative, multiplication in \mathbb{Q}^* is associative. \square

Example 3.3.2 A Subgroup of the Nonzero Complex Numbers. Recall that \mathbb{C}^* is the multiplicative group of nonzero complex numbers. Let $H = \{1, -1, i, -i\}$. Then H is a subgroup of \mathbb{C}^* . It is quite easy to verify that H is a group under multiplication and that $H \subset \mathbb{C}^*$. \square

Example 3.3.3 A Subgroup of Matrices With Determinant One. Let $SL_2(\mathbb{R})$ be the subset of $GL_2(\mathbb{R})$ consisting of matrices of determinant one; that

is, a matrix

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

is in $SL_2(\mathbb{R})$ exactly when $ad - bc = 1$. To show that $SL_2(\mathbb{R})$ is a subgroup of the general linear group, we must show that it is a group under matrix multiplication. The 2×2 identity matrix is in $SL_2(\mathbb{R})$, as is the inverse of the matrix A :

$$A^{-1} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}.$$

It remains to show that multiplication is closed; that is, that the product of two matrices of determinant one also has determinant one. We will leave this task as an exercise. The group $SL_2(\mathbb{R})$ is called the **special linear group**. \square

Example 3.3.4 Groups, Subsets, Operations. It is important to realize that a subset H of a group G can be a group without being a subgroup of G . For H to be a subgroup of G it must inherit G 's binary operation. The set of all 2×2 matrices, $M_2(\mathbb{R})$, forms a group under the operation of addition. The 2×2 general linear group is a subset of $M_2(\mathbb{R})$ and is a group under matrix multiplication, but it is not a subgroup of $M_2(\mathbb{R})$. If we add two invertible matrices, we do not necessarily obtain another invertible matrix. Observe that

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} + \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix},$$

but the zero matrix is not in $GL_2(\mathbb{R})$. \square

Example 3.3.5 Structurally Different Groups. One way of telling whether or not two groups are the same is by examining their subgroups. Other than the trivial subgroup and the group itself, the group \mathbb{Z}_4 has a single subgroup consisting of the elements 0 and 2. From the group \mathbb{Z}_2 , we can form another group of four elements as follows. As a set this group is $\mathbb{Z}_2 \times \mathbb{Z}_2$. We perform the group operation coordinatewise; that is, $(a, b) + (c, d) = (a+c, b+d)$. [Figure 3.3.6](#) is an addition table for $\mathbb{Z}_2 \times \mathbb{Z}_2$. Since there are three nontrivial proper subgroups of $\mathbb{Z}_2 \times \mathbb{Z}_2$, $H_1 = \{(0, 0), (0, 1)\}$, $H_2 = \{(0, 0), (1, 0)\}$, and $H_3 = \{(0, 0), (1, 1)\}$, \mathbb{Z}_4 and $\mathbb{Z}_2 \times \mathbb{Z}_2$ must be different groups.

+	(0, 0)	(0, 1)	(1, 0)	(1, 1)

3.3.2 Some Subgroup Theorems

Let us examine some criteria for determining exactly when a subset of a group is a subgroup.

Proposition 3.3.7 *A subset H of G is a subgroup if and only if it satisfies the following conditions.*

1. The identity e of G is in H .

2. If $h_1, h_2 \in H$, then $h_1h_2 \in H$.
3. If $h \in H$, then $h^{-1} \in H$.

Proof. First suppose that H is a subgroup of G . We must show that the three conditions hold. Since H is a group, it must have an identity e_H . We must show that $e_H = e$, where e is the identity of G . We know that $e_H e_H = e_H$ and that $e e_H = e_H e = e_H$; hence, $e e_H = e_H e_H$. By right-hand cancellation, $e = e_H$. The second condition holds since a subgroup H is a group. To prove the third condition, let $h \in H$. Since H is a group, there is an element $h' \in H$ such that $hh' = h'h = e$. By the uniqueness of the inverse in G , $h' = h^{-1}$.

Conversely, if the three conditions hold, we must show that H is a group under the same operation as G ; however, these conditions plus the associativity of the binary operation are exactly the axioms stated in the definition of a group. ■

Proposition 3.3.8 *Let H be a subset of a group G . Then H is a subgroup of G if and only if $H \neq \emptyset$, and whenever $g, h \in H$ then gh^{-1} is in H .*

Proof. First assume that H is a subgroup of G . We wish to show that $gh^{-1} \in H$ whenever g and h are in H . Since h is in H , its inverse h^{-1} must also be in H . Because of the closure of the group operation, $gh^{-1} \in H$.

Conversely, suppose that $H \subset G$ such that $H \neq \emptyset$ and $gh^{-1} \in H$ whenever $g, h \in H$. If $g \in H$, then $gg^{-1} = e$ is in H . If $g \in H$, then $eg^{-1} = g^{-1}$ is also in H . Now let $h_1, h_2 \in H$. We must show that their product is also in H . However, $h_1(h_2^{-1})^{-1} = h_1h_2 \in H$. Hence, H is a subgroup of G . ■

Remark 3.3.9 Sage. The first half of this text is about group theory. Sage includes Groups, Algorithms and Programming (GAP), a program designed primarily for just group theory, and in continuous development since 1986. Many of Sage's computations for groups ultimately are performed by GAP.

3.4 Sage

Many of the groups discussed in this chapter are available for study in Sage. It is important to understand that sets that form algebraic objects (groups in this chapter) are called “parents” in Sage, and elements of these objects are called, well, “elements.” So every element belongs to a parent (in other words, is contained in some set). We can ask about properties of parents (finite? order? abelian?), and we can ask about properties of individual elements (identity? inverse?). In the following we will show you how to create some of these common groups and begin to explore their properties with Sage.

3.4.1 Integers mod n

```
Z8 = Integers(8)
Z8
```

Ring of integers modulo 8

```
Z8.list()
```

```
[0, 1, 2, 3, 4, 5, 6, 7]
```

```
a = Z8.an_element(); a
```

0

```
a.parent()
```

Ring of integers modulo 8

We would like to work with elements of Z_8 . If you were to type a 6 into a compute cell right now, what would you mean? The integer 6, the rational number $\frac{6}{1}$, the real number 6.00000, or the complex number $6.00000+0.00000i$? Or perhaps you really do want the integer 6 mod 8? Sage really has no idea what you mean or want. To make this clear, you can “coerce” 6 into Z_8 with the syntax $Z_8(6)$. Without this, Sage will treat a input number like 6 as an integer, the simplest possible interpretation in some sense. Study the following carefully, where we first work with “normal” integers and then with integers mod 8.

```
a = 6
a
```

6

```
a.parent()
```

Integer Ring

```
b = 7
c = a + b; c
```

13

```
d = Z8(6)
d
```

6

```
d.parent()
```

Ring of integers modulo 8

```
e = Z8(7)
f = d+e; f
```

5

```
g = Z8(85); g
```

5

```
f == g
```

True

Z_8 is a bit unusual as a first example, since it has two operations defined, both addition and multiplication, with addition forming a group, and multiplication not forming a group. Still, we can work with the additive portion, here forming the Cayley table for the addition.

```
Z8.addition_table(names='elements')
```

```
+  0 1 2 3 4 5 6 7
+-----+
0| 0 1 2 3 4 5 6 7
1| 1 2 3 4 5 6 7 0
2| 2 3 4 5 6 7 0 1
3| 3 4 5 6 7 0 1 2
4| 4 5 6 7 0 1 2 3
5| 5 6 7 0 1 2 3 4
6| 6 7 0 1 2 3 4 5
7| 7 0 1 2 3 4 5 6
```

When n is a prime number, the multiplicative structure (excluding zero), will also form a group.

The integers mod n are very important, so Sage implements both addition and multiplication together. Groups of symmetries are a better example of how Sage implements groups, since there is just one operation present.

3.4.2 Groups of symmetries

The symmetries of some geometric shapes are already defined in Sage, albeit with different names. They are implemented as “permutation groups” which we will begin to study carefully in Chapter 5.

Sage uses integers to label vertices, starting the count at 1, instead of letters. Elements by default are printed using “cycle notation” which we will see described carefully in Chapter 5. Here is an example, with both the mathematics and Sage. For the Sage part, we create the group of symmetries and then create the symmetry ρ_2 with coercion, followed by outputting the element in cycle notation. Then we create just the *bottom row* of the notation we are using for permutations.

$$\rho_2 = \begin{pmatrix} A & B & C \\ C & A & B \end{pmatrix} = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 1 & 2 \end{pmatrix}$$

```
triangle = SymmetricGroup(3)
rho2 = triangle([3,1,2])
rho2
```

```
(1, 3, 2)
```

```
[rho2(x) for x in triangle.domain()]
```

```
[3, 1, 2]
```

The final list comprehension deserves comment. The `.domain()` method gives a list of the symbols used for the permutation group `triangle` and then `rho2` is employed with syntax like it is a function (it *is* a function) to create the images that would occupy the bottom row.

With a double list comprehension we can list all six elements of the group in the “bottom row” format. A good exercise would be to pair up each element with its name as given in [Figure 3.1.6](#).

```
[[a(x) for x in triangle.domain()] for a in triangle]
```

```
[[1, 2, 3], [2, 1, 3], [2, 3, 1], [3, 1, 2], [1, 3, 2], [3,
2, 1]]
```

Different books, different authors, different software all have different ideas about the order in which to write multiplication of functions. This textbook builds on the idea of composition of functions, so that fg is the composition $(fg)(x) = f(g(x))$ and it is natural to apply g first. Sage takes the opposite view and since we write fg , Sage will understand that we want to do f first. Neither approach is wrong, and neither is necessarily superior, they are just different and there are good arguments for either one. When you consult other books that work with permutation groups, you want to first determine which approach it takes.

The translation here between the text and Sage will be worthwhile practice. Here we will reprise the discussion at the end of [Section 3.1](#), but reverse the order on each product to compute Sage-style and exactly mirror what the text does.

```
mu1 = triangle([1,3,2])
mu2 = triangle([3,2,1])
mu3 = triangle([2,1,3])
rho1 = triangle([2,3,1])
product = rho1*mu1
product == mu2
```

True

```
[product(x) for x in triangle.domain()]
```

[3, 2, 1]

```
rho1*mu1 == mu1*rho1
```

False

```
mu1*rho1 == mu3
```

True

Now that we understand that Sage does multiplication in reverse, we can compute the Cayley table for this group. Default behavior is to just name elements of a group as letters, `a`, `b`, `c`, `\dots` in the same order that the `.list()` command would produce the elements of the group. But you can also print the elements in the table as themselves (that uses cycle notation here), or you can give the elements names. We will use `u` as shorthand for μ and `r` as shorthand for ρ .

```
triangle.cayley_table()
```

```
* a b c d e f
+-----+
a| a b c d e f
b| b a f e d c
c| c e d a f b
d| d f a c b e
e| e c b f a d
f| f d e b c a
```

```
triangle.cayley_table(names='elements')
```

```

      *      () (1,2) (1,2,3) (1,3,2) (2,3) (1,3)
      +-----+
      ()|      () (1,2) (1,2,3) (1,3,2) (2,3) (1,3)
  (1,2)| (1,2)      () (1,3) (2,3) (1,3,2) (1,2,3)
(1,2,3)| (1,2,3) (2,3) (1,3,2)      () (1,3) (1,2)
(1,3,2)| (1,3,2) (1,3)      () (1,2,3) (1,2) (2,3)
  (2,3)| (2,3) (1,2,3) (1,2) (1,3)      () (1,3,2)
  (1,3)| (1,3) (1,3,2) (2,3) (1,2) (1,2,3)      ()

```

```
triangle.cayley_table(names=['id','u1','u3','r1','r2','u2'])
```

```

*   id u1 u3 r1 r2 u2
+-----+
id| id u1 u3 r1 r2 u2
u1| u1 id u2 r2 r1 u3
u3| u3 r2 r1 id u2 u1
r1| r1 u2 id u3 u1 r2
r2| r2 u3 u1 u2 id r1
u2| u2 r1 r2 u1 u3 id

```

You should verify that the table above is correct, just like Table 3.2 is correct. Remember that the convention is to multiply a row label times a column label, in that order. However, to do a check across the two tables, you will need to recall the difference in ordering between your textbook and Sage.

3.4.3 Quaternions

Sage implements the quaternions, but the elements are not matrices, but rather are permutations. Despite appearances the structure is identical. It should not matter which version you have in mind (matrices or permutations) if you build the Cayley table and use the default behavior of using letters to name the elements. As permutations, or as letters, can you identify -1 , I , J and K ?

```
Q = QuaternionGroup()
[[a(x) for x in Q.domain()] for a in Q]
```

```

[[1, 2, 3, 4, 5, 6, 7, 8], [2, 3, 4, 1, 6, 7, 8, 5],
 [5, 8, 7, 6, 3, 2, 1, 4], [3, 4, 1, 2, 7, 8, 5, 6],
 [6, 5, 8, 7, 4, 3, 2, 1], [8, 7, 6, 5, 2, 1, 4, 3],
 [4, 1, 2, 3, 8, 5, 6, 7], [7, 6, 5, 8, 1, 4, 3, 2]]

```

```
Q.cayley_table()
```

```

*   a b c d e f g h
+-----+
a| a b c d e f g h
b| b d f g c h a e
c| c e d h g b f a
d| d g h a f e b c
e| e h b f d a c g
f| f c g e a d h b
g| g a e b h c d f
h| h f a c b g e d

```

It should be fairly obvious that a is the identity element of the group (1), either from its behavior in the table, or from its “bottom row” representation in the list above. And if you prefer, you can ask Sage.

```
id = Q.identity()
[id(x) for x in Q.domain()]
```

```
[1, 2, 3, 4, 5, 6, 7, 8]
```

Now -1 should have the property that $-1 \cdot -1 = 1$. We see that the identity element a is on the diagonal of the Cayley table only when we compute $c*c$. We can verify this easily, borrowing the third “bottom row” element from the list above. With this information, once we locate I , we can easily compute $-I$, and so on.

```
minus_one = Q([3, 4, 1, 2, 7, 8, 5, 6])
minus_one*minus_one == Q.identity()
```

```
True
```

See if you can pair up the letters with all eight elements of the quaternions. Be a bit careful with your names, the symbol I is used by Sage for the imaginary number i (which we will use below), but Sage will silently let you redefine it to be anything you like. Same goes for lower-case i . So call your elements of the quaternions something like QI , QJ , QK to avoid confusion.

As we begin to work with groups it is instructive to work with the actual elements. But many properties of groups are totally independent of the order we use for multiplication, or the names or representations we use for the elements. Here are facts about the quaternions we can compute without any knowledge of just how the elements are written or multiplied.

```
Q.is_finite()
```

```
True
```

```
Q.order()
```

```
8
```

```
Q.is_abelian()
```

```
False
```

3.4.4 Subgroups

The best techniques for creating subgroups will come in future chapters, but we can create some groups that are naturally subgroups of other groups.

Elements of the quaternions were represented by certain permutations of the integers 1 through 8. We can also build the group of *all* permutations of these eight integers. It gets pretty big, so do not list it unless you want a lot of output! (I dare you.)

```
S8 = SymmetricGroup(8)
a = S8.random_element()
[a(x) for x in S8.domain()] # random
```

```
[5, 2, 6, 4, 1, 8, 3, 7]
```

As a demonstration of reusing chunks of Sage code, we duplicate the previous example. But in each case the code lives in an external file, just once. So if you wanted to use setup code in more than one division, you could put it in a

file and incorporate it similarly. Here we do not test the second instance, and so do not include expected output either. Typically, you would do this copy somewhere further away.

```
S8 = SymmetricGroup(8)
a = S8.random_element()
[a(x) for x in S8.domain()] # random
```

```
S8.order()
```

40320

The quaternions, Q , is a subgroup of the full group of all permutations, the symmetric group S_8 or $S8$, and Sage regards this as a property of Q .

```
Q.is_subgroup(S8)
```

True

In Sage the complex numbers are known by the name CC . We can create a list of the elements in the subgroup described in [Example 3.2.9](#). Then we can verify that this set is a subgroup by examining the Cayley table, using multiplication as the operation.

```
H = [CC(1), CC(-1), CC(I), CC(-I)]
CC.multiplication_table(elements=H,
                        names=['1', '-1', 'i', '-i'])
```

```
*   1 -1  i -i
   +-----+
  1|  1 -1  i -i
 -1| -1  1 -i  i
  i|  i -i -1  1
 -i| -i  i  1 -1
```

3.5 Exercises

1. Find all $x \in \mathbb{Z}$ satisfying each of the following equations.

(a) $3x \equiv 2 \pmod{7}$

(d) $9x \equiv 3 \pmod{5}$

(b) $5x + 1 \equiv 13 \pmod{23}$

(e) $5x \equiv 1 \pmod{6}$

(c) $5x + 1 \equiv 13 \pmod{26}$

(f) $3x \equiv 1 \pmod{6}$

Hint. (a) $3 + 7\mathbb{Z} = \{\dots, -4, 3, 10, \dots\}$; (c) $18 + 26\mathbb{Z}$; (e) $5 + 6\mathbb{Z}$.

2. Which of the following multiplication tables defined on the set $G = \{a, b, c, d\}$ form a group? Support your answer in each case.

(a)

o	a	b	c	d
a	a	c	d	a
b	b	b	c	d
c	c	d	a	b
d	d	a	b	c

(c)

o	a	b	c	d
a	a	b	c	d
b	b	c	d	a
c	c	d	a	b
d	d	a	b	c

(b)

o	a	b	c	d
a	a	b	c	d
b	b	a	d	c
c	c	d	a	b
d	d	c	b	a

(d)

o	a	b	c	d
a	a	b	c	d
b	b	a	c	d
c	c	b	a	d
d	d	d	b	c

Hint. (a) Not a group; (c) a group.

- Write out Cayley tables for groups formed by the symmetries of a rectangle and for $(\mathbb{Z}_4, +)$. How many elements are in each group? Are the groups the same? Why or why not?
- Describe the symmetries of a rhombus and prove that the set of symmetries forms a group. Give Cayley tables for both the symmetries of a rectangle and the symmetries of a rhombus. Are the symmetries of a rectangle and those of a rhombus the same?
- Describe the symmetries of a square and prove that the set of symmetries is a group. Give a Cayley table for the symmetries. How many ways can the vertices of a square be permuted? Is each permutation necessarily a symmetry of the square? The symmetry group of the square is denoted by D_4 .
- Give a multiplication table for the group $U(12)$.

Hint.

	1	5	7	11
1	1	5	7	11
5	5	1	11	7
7	7	11	1	5
11	11	7	5	1

- Let $S = \mathbb{R} \setminus \{-1\}$ and define a binary operation on S by $a * b = a + b + ab$. Prove that $(S, *)$ is an abelian group.
- Give an example of two elements A and B in $GL_2(\mathbb{R})$ with $AB \neq BA$.
- Prove that the product of two matrices in $SL_2(\mathbb{R})$ has determinant one.
- Prove that the set of matrices of the form

$$\begin{pmatrix} 1 & x & y \\ 0 & 1 & z \\ 0 & 0 & 1 \end{pmatrix}$$

is a group under matrix multiplication. This group, known as the **Heisenberg group**, is important in quantum physics. Matrix multiplication in the Heisenberg group is defined by

$$\begin{pmatrix} 1 & x & y \\ 0 & 1 & z \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & x' & y' \\ 0 & 1 & z' \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & x + x' & y + y' + xz' \\ 0 & 1 & z + z' \\ 0 & 0 & 1 \end{pmatrix}.$$

11. Prove that $\det(AB) = \det(A)\det(B)$ in $GL_2(\mathbb{R})$. Use this result to show that the binary operation in the group $GL_2(\mathbb{R})$ is closed; that is, if A and B are in $GL_2(\mathbb{R})$, then $AB \in GL_2(\mathbb{R})$.

12. Let $\mathbb{Z}_2^n = \{(a_1, a_2, \dots, a_n) : a_i \in \mathbb{Z}_2\}$. Define a binary operation on \mathbb{Z}_2^n by

$$(a_1, a_2, \dots, a_n) + (b_1, b_2, \dots, b_n) = (a_1 + b_1, a_2 + b_2, \dots, a_n + b_n).$$

Prove that \mathbb{Z}_2^n is a group under this operation. This group is important in algebraic coding theory.

13. Show that $\mathbb{R}^* = \mathbb{R} \setminus \{0\}$ is a group under the operation of multiplication.

14. Given the groups \mathbb{R}^* and \mathbb{Z} , let $G = \mathbb{R}^* \times \mathbb{Z}$. Define a binary operation \circ on G by $(a, m) \circ (b, n) = (ab, m + n)$. Show that G is a group under this operation.

15. Prove or disprove that every group containing six elements is abelian.

Hint. There is a nonabelian group containing six elements.

16. Give a specific example of some group G and elements $g, h \in G$ where $(gh)^n \neq g^n h^n$.

Hint. Look at the symmetry group of an equilateral triangle or a square.

17. Give an example of three different groups with eight elements. Why are the groups different?

Hint. There are five different groups of order 8.

18. Show that there are $n!$ permutations of a set containing n items.

Hint. Let

$$\sigma = \begin{pmatrix} 1 & 2 & \cdots & n \\ a_1 & a_2 & \cdots & a_n \end{pmatrix}$$

be in S_n . All of the a_i s must be distinct. There are n ways to choose a_1 , $n - 1$ ways to choose a_2 , \dots , 2 ways to choose a_{n-1} , and only one way to choose a_n . Therefore, we can form σ in $n(n - 1) \cdots 2 \cdot 1 = n!$ ways.

19. Show that

$$0 + a \equiv a + 0 \equiv a \pmod{n}$$

for all $a \in \mathbb{Z}_n$.

20. Prove that there is a multiplicative identity for the integers modulo n :

$$a \cdot 1 \equiv a \pmod{n}.$$

21. For each $a \in \mathbb{Z}_n$ find an element $b \in \mathbb{Z}_n$ such that

$$a + b \equiv b + a \equiv 0 \pmod{n}.$$

22. Show that addition and multiplication mod n are well defined operations. That is, show that the operations do not depend on the choice of the representative from the equivalence classes mod n .

23. Show that addition and multiplication mod n are associative operations.

24. Show that multiplication distributes over addition modulo n :

$$a(b + c) \equiv ab + ac \pmod{n}.$$

25. Let a and b be elements in a group G . Prove that $ab^n a^{-1} = (aba^{-1})^n$ for $n \in \mathbb{Z}$.

Hint.

$$(aba^{-1})^n = (aba^{-1})(aba^{-1}) \cdots (aba^{-1})$$

$$\begin{aligned}
 &= ab(aa^{-1})b(aa^{-1})b \cdots b(aa^{-1})ba^{-1} \\
 &= ab^n a^{-1}.
 \end{aligned}$$

26. Let $U(n)$ be the group of units in \mathbb{Z}_n . If $n > 2$, prove that there is an element $k \in U(n)$ such that $k^2 = 1$ and $k \neq 1$.
27. Prove that the inverse of $g_1 g_2 \cdots g_n$ is $g_n^{-1} g_{n-1}^{-1} \cdots g_1^{-1}$.
28. Prove the remainder of [Proposition 3.2.14](#): if G is a group and $a, b \in G$, then the equation $xa = b$ has a unique solution in G .
29. Prove [Theorem 3.2.16](#).
30. Prove the right and left cancellation laws for a group G ; that is, show that in the group G , $ba = ca$ implies $b = c$ and $ab = ac$ implies $b = c$ for elements $a, b, c \in G$.
31. Show that if $a^2 = e$ for all elements a in a group G , then G must be abelian.
- Hint.** Since $abab = (ab)^2 = e = a^2 b^2 = aabb$, we know that $ba = ab$.
32. Show that if G is a finite group of even order, then there is an $a \in G$ such that a is not the identity and $a^2 = e$.
33. Let G be a group and suppose that $(ab)^2 = a^2 b^2$ for all a and b in G . Prove that G is an abelian group.
34. Find all the subgroups of $\mathbb{Z}_3 \times \mathbb{Z}_3$. Use this information to show that $\mathbb{Z}_3 \times \mathbb{Z}_3$ is not the same group as \mathbb{Z}_9 . (See [Example 3.3.5](#) for a short description of the product of groups.)
35. Find all the subgroups of the symmetry group of an equilateral triangle.
- Hint.** $H_1 = \{id\}$, $H_2 = \{id, \rho_1, \rho_2\}$, $H_3 = \{id, \mu_1\}$, $H_4 = \{id, \mu_2\}$, $H_5 = \{id, \mu_3\}$, S_3 .
36. Compute the subgroups of the symmetry group of a square.
37. Let $H = \{2^k : k \in \mathbb{Z}\}$. Show that H is a subgroup of \mathbb{Q}^* .
38. Let $n = 0, 1, 2, \dots$ and $n\mathbb{Z} = \{nk : k \in \mathbb{Z}\}$. Prove that $n\mathbb{Z}$ is a subgroup of \mathbb{Z} . Show that these subgroups are the only subgroups of \mathbb{Z} .
39. Let $\mathbb{T} = \{z \in \mathbb{C}^* : |z| = 1\}$. Prove that \mathbb{T} is a subgroup of \mathbb{C}^* .
- 40.

$$\begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

where $\theta \in \mathbb{R}$. Prove that G is a subgroup of $SL_2(\mathbb{R})$.

41. Prove that

$$G = \{a + b\sqrt{2} : a, b \in \mathbb{Q} \text{ and } a \text{ and } b \text{ are not both zero}\}$$

is a subgroup of \mathbb{R}^* under the group operation of multiplication.

Hint. The identity of G is $1 = 1 + 0\sqrt{2}$. Since $(a + b\sqrt{2})(c + d\sqrt{2}) = (ac + 2bd) + (ad + bc)\sqrt{2}$, G is closed under multiplication. Finally, $(a + b\sqrt{2})^{-1} = a/(a^2 - 2b^2) - b\sqrt{2}/(a^2 - 2b^2)$.

42. Let G be the group of 2×2 matrices under addition and

$$H = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} : a + d = 0 \right\}.$$

Prove that H is a subgroup of G .

43. Prove or disprove: $SL_2(\mathbb{Z})$, the set of 2×2 matrices with integer entries and determinant one, is a subgroup of $SL_2(\mathbb{R})$.
44. List the subgroups of the quaternion group, Q_8 .
45. Prove that the intersection of two subgroups of a group G is also a subgroup of G .
46. Prove or disprove: If H and K are subgroups of a group G , then $H \cup K$ is a subgroup of G .
- Hint.** Look at S_3 .
47. Prove or disprove: If H and K are subgroups of a group G , then $HK = \{hk : h \in H \text{ and } k \in K\}$ is a subgroup of G . What if G is abelian?
48. Let G be a group and $g \in G$. Show that

$$Z(G) = \{x \in G : gx = xg \text{ for all } g \in G\}$$

is a subgroup of G . This subgroup is called the **center** of G .

49. Let a and b be elements of a group G . If $a^4b = ba$ and $a^3 = e$, prove that $ab = ba$.
- Hint.** Since $a^4b = ba$, it must be the case that $b = a^6b = a^2ba$, and we can conclude that $ab = a^3ba = ba$.
50. Give an example of an infinite group in which every nontrivial subgroup is infinite.
51. If $xy = x^{-1}y^{-1}$ for all x and y in G , prove that G must be abelian.
52. Prove or disprove: Every proper subgroup of a nonabelian group is nonabelian.
53. Let H be a subgroup of G and

$$C(H) = \{g \in G : gh = hg \text{ for all } h \in H\}.$$

Prove $C(H)$ is a subgroup of G . This subgroup is called the **centralizer** of H in G .

54. Let H be a subgroup of G . If $g \in G$, show that $gHg^{-1} = \{g^{-1}hg : h \in H\}$ is also a subgroup of G .

3.6 Additional Exercises: Detecting Errors

1. **UPC Symbols.** Universal Product Code (UPC) symbols are found on most products in grocery and retail stores. The UPC symbol is a 12-digit code identifying the manufacturer of a product and the product itself (Figure 3.6.1). The first 11 digits contain information about the product; the twelfth digit is used for error detection. If $d_1d_2 \cdots d_{12}$ is a valid UPC number, then

$$3 \cdot d_1 + 1 \cdot d_2 + 3 \cdot d_3 + \cdots + 3 \cdot d_{11} + 1 \cdot d_{12} \equiv 0 \pmod{10}.$$

- (a) Show that the UPC number 0-50000-30042-6, which appears in Figure 3.6.1, is a valid UPC number.
- (b) Show that the number 0-50000-30043-6 is not a valid UPC number.
- (c) Write a formula to calculate the check digit, d_{12} , in the UPC number.
- (d) The UPC error detection scheme can detect most transposition errors; that is, it can determine if two digits have been interchanged.

Show that the transposition error 0-05000-30042-6 is not detected. Find a transposition error that is detected. Can you find a general rule for the types of transposition errors that can be detected?

- (e) Write a program that will determine whether or not a UPC number is valid.

Figure 3.6.1: A UPC code

2. It is often useful to use an inner product notation for this type of error detection scheme; hence, we will use the notion

$$(d_1, d_2, \dots, d_k) \cdot (w_1, w_2, \dots, w_k) \equiv 0 \pmod{n}$$

to mean

$$d_1 w_1 + d_2 w_2 + \dots + d_k w_k \equiv 0 \pmod{n}.$$

Suppose that $(d_1, d_2, \dots, d_k) \cdot (w_1, w_2, \dots, w_k) \equiv 0 \pmod{n}$ is an error detection scheme for the k -digit identification number $d_1 d_2 \dots d_k$, where $0 \leq d_i < n$. Prove that all single-digit errors are detected if and only if $\gcd(w_i, n) = 1$ for $1 \leq i \leq k$.

3. Let $(d_1, d_2, \dots, d_k) \cdot (w_1, w_2, \dots, w_k) \equiv 0 \pmod{n}$ be an error detection scheme for the k -digit identification number $d_1 d_2 \dots d_k$, where $0 \leq d_i < n$. Prove that all transposition errors of two digits d_i and d_j are detected if and only if $\gcd(w_i - w_j, n) = 1$ for i and j between 1 and k .
4. **ISBN Codes.** Every book has an International Standard Book Number (ISBN) code. This is a 10-digit code indicating the book's publisher and title. The tenth digit is a check digit satisfying

$$(d_1, d_2, \dots, d_{10}) \cdot (10, 9, \dots, 1) \equiv 0 \pmod{11}.$$

One problem is that d_{10} might have to be a 10 to make the inner product zero; in this case, 11 digits would be needed to make this scheme work. Therefore, the character X is used for the eleventh digit. So ISBN 3-540-96035-X is a valid ISBN code.

- (a) Is ISBN 0-534-91500-0 a valid ISBN code? What about ISBN 0-534-91700-0 and ISBN 0-534-19500-0?
- (b) Does this method detect all single-digit errors? What about all transposition errors?
- (c) How many different ISBN codes are there?
- (d) Write a computer program that will calculate the check digit for the first nine digits of an ISBN code.
- (e) A publisher has houses in Germany and the United States. Its German prefix is 3-540. If its United States prefix will be 0-abc, find abc such that the rest of the ISBN code will be the same for a book printed in Germany and in the United States. Under the ISBN

coding method the first digit identifies the language; German is 3 and English is 0. The next group of numbers identifies the publisher, and the last group identifies the specific book.

3.7 Sage Exercises

These exercises are about becoming comfortable working with groups in Sage.

1. Create the groups `CyclicPermutationGroup(8)` and `DihedralGroup(4)` and name these groups `C` and `D`, respectively. We will understand these constructions better shortly, but for now just understand that both objects you create are actually groups.
2. Check that `C` and `D` have the same size by using the `.order()` method. Determine which group is abelian, and which is not, by using the `.is_abelian()` method.
3. Use the `.cayley_table()` method to create the Cayley table for each group.
4. Write a nicely formatted discussion identifying differences between the two groups that are discernible in properties of their Cayley tables. In other words, what is `{\em different}` about these two groups that you can “see” in the Cayley tables? (In the Sage notebook, a Shift-click on a blue bar will bring up a mini-word-processor, and you can use dollar signs to embed mathematics formatted using `TeX` syntax.)
5. For `C` locate the one subgroup of order 4. The group `D` has three subgroups of order 4. Select one of the three subgroups of `D` that has a different structure than the subgroup you obtained from `C`. The `.subgroups()` method will give you a list of all of the subgroups to help you get started. A Cayley table will help you tell the difference between the two subgroups. What properties of these tables did you use to determine the difference in the structure of the subgroups?
6. The `.subgroup(elt_list)` method of a group will create the smallest subgroup containing the specified elements of the group, when given the elements as a list `elt_list`. Use this command to discover the shortest list of elements necessary to recreate the subgroups you found in the previous exercise. The equality comparison, `==`, can be used to test if two subgroups are equal.

Chapter 4

Cyclic Groups

The groups \mathbb{Z} and \mathbb{Z}_n , which are among the most familiar and easily understood groups, are both examples of what are called cyclic groups. In this chapter we will study the properties of cyclic groups and cyclic subgroups, which play a fundamental part in the classification of all abelian groups.

4.1 Cyclic groups

Often a subgroup will depend entirely on a single element of the group; that is, knowing that particular element will allow us to compute any other element in the subgroup.

Example 4.1.1 An Infinite Cyclic Subgroup, Modular Addition. Suppose that we consider $3 \in \mathbb{Z}$ and look at all multiples (both positive and negative) of 3. As a set, this is

$$3\mathbb{Z} = \{\dots, -3, 0, 3, 6, \dots\}.$$

It is easy to see that $3\mathbb{Z}$ is a subgroup of the integers. This subgroup is completely determined by the element 3 since we can obtain all of the other elements of the group by taking multiples of 3. Every element in the subgroup is “generated” by 3. \square

Example 4.1.2 An Infinite Cyclic Subgroup, Multiplication of Rational Numbers. If $H = \{2^n : n \in \mathbb{Z}\}$, then H is a subgroup of the multiplicative group of nonzero rational numbers, \mathbb{Q}^* . If $a = 2^m$ and $b = 2^n$ are in H , then $ab^{-1} = 2^m 2^{-n} = 2^{m-n}$ is also in H . By [Proposition 3.3.8](#), H is a subgroup of \mathbb{Q}^* determined by the element 2. \square

Theorem 4.1.3 *Let G be a group and a be any element in G . Then the set*

$$\langle a \rangle = \{a^k : k \in \mathbb{Z}\}$$

is a subgroup of G . Furthermore, $\langle a \rangle$ is the smallest subgroup of G that contains a .

Proof. The identity is in $\langle a \rangle$ since $a^0 = e$. If g and h are any two elements in $\langle a \rangle$, then by the definition of $\langle a \rangle$ we can write $g = a^m$ and $h = a^n$ for some integers m and n . So $gh = a^m a^n = a^{m+n}$ is again in $\langle a \rangle$. Finally, if $g = a^n$ in $\langle a \rangle$, then the inverse $g^{-1} = a^{-n}$ is also in $\langle a \rangle$. Clearly, any subgroup H of

G containing a must contain all the powers of a by closure; hence, H contains $\langle a \rangle$. Therefore, $\langle a \rangle$ is the smallest subgroup of G containing a . ■

Remark 4.1.4 If we are using the “+” notation, as in the case of the integers under addition, we write $\langle a \rangle = \{na : n \in \mathbb{Z}\}$.

For $a \in G$, we call $\langle a \rangle$ the **cyclic subgroup** generated by a . If G contains some element a such that $G = \langle a \rangle$, then G is a **cyclic group**. In this case a is a **generator** of G . If a is an element of a group G , we define the **order** of a to be the smallest positive integer n such that $a^n = e$, and we write $|a| = n$. If there is no such integer n , we say that the order of a is infinite and write $|a| = \infty$ to denote the order of a .

Example 4.1.5 Generators of a Finite Cyclic Group. Notice that a cyclic group can have more than a single generator. Both 1 and 5 generate \mathbb{Z}_6 ; hence, \mathbb{Z}_6 is a cyclic group. Not every element in a cyclic group is necessarily a generator of the group. The order of $2 \in \mathbb{Z}_6$ is 3. The cyclic subgroup generated by 2 is $\langle 2 \rangle = \{0, 2, 4\}$. □

The groups \mathbb{Z} and \mathbb{Z}_n are cyclic groups. The elements 1 and -1 are generators for \mathbb{Z} . We can certainly generate \mathbb{Z}_n with 1 although there may be other generators of \mathbb{Z}_n , as in the case of \mathbb{Z}_6 .

Example 4.1.6 A Cyclic Group of Units. The group of units, $U(9)$, in \mathbb{Z}_9 is a cyclic group. As a set, $U(9)$ is $\{1, 2, 4, 5, 7, 8\}$. The element 2 is a generator for $U(9)$ since

$$\begin{array}{ll} 2^1 = 2 & 2^2 = 4 \\ 2^3 = 8 & 2^4 = 7 \\ 2^5 = 5 & 2^6 = 1. \end{array}$$

□

Example 4.1.7 A Group That is Not Cyclic. Not every group is a cyclic group. Consider the symmetry group of an equilateral triangle S_3 . The subgroups of S_3 are shown in Figure 4.1.8. Notice that every subgroup is cyclic; however, no single element generates the entire group. □

Figure 4.1.8: Subgroups of S_3

Theorem 4.1.9 Every cyclic group is abelian.

Proof. Let G be a cyclic group and $a \in G$ be a generator for G . If g and h are in G , then they can be written as powers of a , say $g = a^r$ and $h = a^s$. Since

$$gh = a^r a^s = a^{r+s} = a^{s+r} = a^s a^r = hg,$$

G is abelian. ■

4.2 Subgroups of a Cyclic Group

We can ask some interesting questions about cyclic subgroups of a group and subgroups of a cyclic group. If G is a group, which subgroups of G are cyclic? If G is a cyclic group, what type of subgroups does G possess?

Theorem 4.2.1 *Every subgroup of a cyclic group is cyclic.*

Proof. The main tools used in this proof are the division algorithm and the Principle of Well-Ordering. Let G be a cyclic group generated by a and suppose that H is a subgroup of G . If $H = \{e\}$, then trivially H is cyclic. Suppose that H contains some other element g distinct from the identity. Then g can be written as a^n for some integer n . Since H is a subgroup, $g^{-1} = a^{-n}$ must also be in H . Since either n or $-n$ is positive, we can assume that H contains positive powers of a and $n > 0$. Let m be the smallest natural number such that $a^m \in H$. Such an m exists by the Principle of Well-Ordering.

We claim that $h = a^m$ is a generator for H . We must show that every $h' \in H$ can be written as a power of h . Since $h' \in H$ and H is a subgroup of G , $h' = a^k$ for some integer k . Using the division algorithm, we can find numbers q and r such that $k = mq + r$ where $0 \leq r < m$; hence,

$$a^k = a^{mq+r} = (a^m)^q a^r = h^q a^r.$$

So $a^r = a^k h^{-q}$. Since a^k and h^{-q} are in H , a^r must also be in H . However, m was the smallest positive number such that a^m was in H ; consequently, $r = 0$ and so $k = mq$. Therefore,

$$h' = a^k = a^{mq} = h^q$$

and H is generated by h . ■

Corollary 4.2.2 *The subgroups of \mathbb{Z} are exactly $n\mathbb{Z}$ for $n = 0, 1, 2, \dots$*

Proposition 4.2.3 *Let G be a cyclic group of order n and suppose that a is a generator for G . Then $a^k = e$ if and only if n divides k .*

Proof. First suppose that $a^k = e$. By the division algorithm, $k = nq + r$ where $0 \leq r < n$; hence,

$$e = a^k = a^{nq+r} = a^{nq} a^r = ea^r = a^r.$$

Since the smallest positive integer m such that $a^m = e$ is n , $r = 0$.

Conversely, if n divides k , then $k = ns$ for some integer s . Consequently,

$$a^k = a^{ns} = (a^n)^s = e^s = e. \quad \blacksquare$$

Theorem 4.2.4 *Let G be a cyclic group of order n and suppose that $a \in G$ is a generator of the group. If $b = a^k$, then the order of b is n/d , where $d = \gcd(k, n)$.*

Proof. We wish to find the smallest integer m such that $e = b^m = a^{km}$. By [Proposition 4.2.3](#), this is the smallest integer m such that n divides km or, equivalently, n/d divides $m(k/d)$. Since d is the greatest common divisor of n and k , n/d and k/d are relatively prime. Hence, for n/d to divide $m(k/d)$ it must divide m . The smallest such m is n/d . ■

Corollary 4.2.5 *The generators of \mathbb{Z}_n are the integers r such that $1 \leq r < n$ and $\gcd(r, n) = 1$.*

Example 4.2.6 A Finite Cyclic Group of Order 16. Let us examine the group \mathbb{Z}_{16} . The numbers 1, 3, 5, 7, 9, 11, 13, and 15 are the elements of \mathbb{Z}_{16} that are relatively prime to 16. Each of these elements generates \mathbb{Z}_{16} . For example,

$$\begin{array}{lll} 1 \cdot 9 = 9 & 2 \cdot 9 = 2 & 3 \cdot 9 = 11 \\ 4 \cdot 9 = 4 & 5 \cdot 9 = 13 & 6 \cdot 9 = 6 \\ 7 \cdot 9 = 15 & 8 \cdot 9 = 8 & 9 \cdot 9 = 1 \\ 10 \cdot 9 = 10 & 11 \cdot 9 = 3 & 12 \cdot 9 = 12 \\ 13 \cdot 9 = 5 & 14 \cdot 9 = 14 & 15 \cdot 9 = 7. \end{array}$$

□

4.3 Cyclic Groups of Complex Numbers

The **complex numbers** are defined as

$$\mathbb{C} = \{a + bi : a, b \in \mathbb{R}\},$$

where $i^2 = -1$. If $z = a + bi$, then a is the **real part** of z and b is the **imaginary part** of z .

To add two complex numbers $z = a + bi$ and $w = c + di$, we just add the corresponding real and imaginary parts:

$$z + w = (a + bi) + (c + di) = (a + c) + (b + d)i.$$

Remembering that $i^2 = -1$, we multiply complex numbers just like polynomials. The product of z and w is

$$(a + bi)(c + di) = ac + bdi^2 + adi + bci = (ac - bd) + (ad + bc)i.$$

Every nonzero complex number $z = a + bi$ has a multiplicative inverse; that is, there exists a $z^{-1} \in \mathbb{C}^*$ such that $zz^{-1} = z^{-1}z = 1$. If $z = a + bi$, then

$$z^{-1} = \frac{a - bi}{a^2 + b^2}.$$

The **complex conjugate** of a complex number $z = a + bi$ is defined to be $\bar{z} = a - bi$. The **absolute value** or **modulus** of $z = a + bi$ is $|z| = \sqrt{a^2 + b^2}$.

Example 4.3.1 Complex Number Operations. Let $z = 2 + 3i$ and $w = 1 - 2i$. Then

$$z + w = (2 + 3i) + (1 - 2i) = 3 + i$$

and

$$zw = (2 + 3i)(1 - 2i) = 8 - i.$$

Also,

$$\begin{aligned} z^{-1} &= \frac{2}{13} - \frac{3}{13}i \\ |z| &= \sqrt{13} \\ \bar{z} &= 2 - 3i. \end{aligned}$$

□

Figure 4.3.2: Rectangular coordinates of a complex number

There are several ways of graphically representing complex numbers. We can represent a complex number $z = a + bi$ as an ordered pair on the xy plane where a is the x (or real) coordinate and b is the y (or imaginary) coordinate. This is called the **rectangular** or **Cartesian** representation. The rectangular representations of $z_1 = 2 + 3i$, $z_2 = 1 - 2i$, and $z_3 = -3 + 2i$ are depicted in [Figure 4.3.2](#).

Figure 4.3.3: Polar coordinates of a complex number

Nonzero complex numbers can also be represented using **polar coordinates**. To specify any nonzero point on the plane, it suffices to give an angle θ from the positive x axis in the counterclockwise direction and a distance r from the origin, as in [Figure 4.3.3](#). We can see that

$$z = a + bi = r(\cos \theta + i \sin \theta).$$

Hence,

$$r = |z| = \sqrt{a^2 + b^2}$$

and

$$\begin{aligned} a &= r \cos \theta \\ b &= r \sin \theta. \end{aligned}$$

We sometimes abbreviate $r(\cos \theta + i \sin \theta)$ as $r \operatorname{cis} \theta$. To assure that the representation of z is well-defined, we also require that $0^\circ \leq \theta < 360^\circ$. If the measurement is in radians, then $0 \leq \theta < 2\pi$.

Example 4.3.4 Complex Numbers in Polar Form. Suppose that $z = 2 \operatorname{cis} 60^\circ$. Then

$$a = 2 \cos 60^\circ = 1$$

and

$$b = 2 \sin 60^\circ = \sqrt{3}.$$

Hence, the rectangular representation is $z = 1 + \sqrt{3}i$.

Conversely, if we are given a rectangular representation of a complex number, it is often useful to know the number's polar representation. If $z = 3\sqrt{2} - 3\sqrt{2}i$, then

$$r = \sqrt{a^2 + b^2} = \sqrt{36} = 6$$

and

$$\theta = \arctan\left(\frac{b}{a}\right) = \arctan(-1) = 315^\circ,$$

so $3\sqrt{2} - 3\sqrt{2}i = 6 \operatorname{cis} 315^\circ$. \square

The polar representation of a complex number makes it easy to find products and powers of complex numbers. The proof of the following proposition is straightforward and is left as an exercise.

Proposition 4.3.5 *Let $z = r \operatorname{cis} \theta$ and $w = s \operatorname{cis} \phi$ be two nonzero complex numbers. Then*

$$zw = rs \operatorname{cis}(\theta + \phi).$$

Example 4.3.6 Multiplication of Complex Numbers in Polar Form. If $z = 3 \operatorname{cis}(\pi/3)$ and $w = 2 \operatorname{cis}(\pi/6)$, then $zw = 6 \operatorname{cis}(\pi/2) = 6i$. \square

Theorem 4.3.7 DeMoivre. *Let $z = r \operatorname{cis} \theta$ be a nonzero complex number. Then*

$$[r \operatorname{cis} \theta]^n = r^n \operatorname{cis}(n\theta)$$

for $n = 1, 2, \dots$

Proof. We will use induction on n (see Section 2.1). For $n = 1$ the theorem is trivial. Assume that the theorem is true for all k such that $1 \leq k \leq n$. Then

$$\begin{aligned} z^{n+1} &= z^n z \\ &= r^n (\cos n\theta + i \sin n\theta) r (\cos \theta + i \sin \theta) \\ &= r^{n+1} [(\cos n\theta \cos \theta - \sin n\theta \sin \theta) + i(\sin n\theta \cos \theta + \cos n\theta \sin \theta)] \\ &= r^{n+1} [\cos(n\theta + \theta) + i \sin(n\theta + \theta)] \\ &= r^{n+1} [\cos(n+1)\theta + i \sin(n+1)\theta]. \quad \blacksquare \end{aligned}$$

Example 4.3.8 Powers of Complex Numbers. Suppose that $z = 1 + i$ and we wish to compute z^{10} . Rather than computing $(1 + i)^{10}$ directly, it is much easier to switch to polar coordinates and calculate z^{10} using DeMoivre's Theorem:

$$\begin{aligned} z^{10} &= (1 + i)^{10} \\ &= \left(\sqrt{2} \operatorname{cis} \left(\frac{\pi}{4}\right)\right)^{10} \\ &= (\sqrt{2})^{10} \operatorname{cis} \left(\frac{5\pi}{2}\right) \\ &= 32 \operatorname{cis} \left(\frac{\pi}{2}\right) \\ &= 32i. \end{aligned}$$

□

The multiplicative group of the complex numbers, \mathbb{C}^* , possesses some interesting subgroups. Whereas \mathbb{Q}^* and \mathbb{R}^* have no interesting subgroups of finite order, \mathbb{C}^* has many. We first consider the **circle group**,

$$\mathbb{T} = \{z \in \mathbb{C} : |z| = 1\}.$$

The following proposition is a direct result of [Proposition 4.3.5](#).

Proposition 4.3.9 *The circle group is a subgroup of \mathbb{C}^* .*

Although the circle group has infinite order, it has many interesting finite subgroups. Suppose that $H = \{1, -1, i, -i\}$. Then H is a subgroup of the circle group. Also, 1, -1 , i , and $-i$ are exactly those complex numbers that satisfy the equation $z^4 = 1$. The complex numbers satisfying the equation $z^n = 1$ are called the **n th roots of unity**.

Theorem 4.3.10 *If $z^n = 1$, then the n th roots of unity are*

$$z = \text{cis}\left(\frac{2k\pi}{n}\right),$$

where $k = 0, 1, \dots, n-1$. Furthermore, the n th roots of unity form a cyclic subgroup of \mathbb{T} of order n .

Proof. By DeMoivre's Theorem,

$$z^n = \text{cis}\left(n \frac{2k\pi}{n}\right) = \text{cis}(2k\pi) = 1.$$

The z 's are distinct since the numbers $2k\pi/n$ are all distinct and are greater than or equal to 0 but less than 2π . We will leave the proof that the n th roots of unity form a cyclic subgroup of \mathbb{T} as an exercise. ■

A generator for the group of the n th roots of unity is called a **primitive n th root of unity**.

Example 4.3.11 Roots of Unity. The 8th roots of unity can be represented as eight equally spaced points on the unit circle ([Figure 4.3.12](#)). The primitive 8th roots of unity are

$$\begin{aligned}\omega &= \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i \\ \omega^3 &= -\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i \\ \omega^5 &= -\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i \\ \omega^7 &= \frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i.\end{aligned}$$

□

Figure 4.3.12: 8th roots of unity

We interrupt this exposition to repeat the previous diagram, wrapped as different figure with a different caption. The TikZ code to produce these diagrams lives in an external file, `tikz/cyclic-roots-unity.tex`, which is pure text, freed from any need to format for XML processing. So, in particular, there is no need to escape ampersands and angle brackets, nor is there employment of the CDATA mechanism. But the real value is that there is just one version to edit, and any changes will be reflected in both copies.

Figure 4.3.13: Repeat: 8th roots of unity

4.4 Large Powers of Integers

Computing large powers can be very time-consuming. Just as anyone can compute 2^2 or 2^8 , everyone knows how to compute

$$2^{2^{1000000}}.$$

However, such numbers are so large that we do not want to attempt the calculations; moreover, past a certain point the computations would not be feasible even if we had every computer in the world at our disposal. Even writing down the decimal representation of a very large number may not be reasonable. It could be thousands or even millions of digits long. However, if we could compute something like $2^{37398332} \pmod{46389}$, we could very easily write the result down since it would be a number between 0 and 46,388. If we want to

compute powers modulo n quickly and efficiently, we will have to be clever.¹

The first thing to notice is that any number a can be written as the sum of distinct powers of 2; that is, we can write

$$a = 2^{k_1} + 2^{k_2} + \cdots + 2^{k_n},$$

where $k_1 < k_2 < \cdots < k_n$. This is just the binary representation of a . For example, the binary representation of 57 is 111001, since we can write $57 = 2^0 + 2^3 + 2^4 + 2^5$.

The laws of exponents still work in \mathbb{Z}_n ; that is, if $b \equiv a^x \pmod{n}$ and $c \equiv a^y \pmod{n}$, then $bc \equiv a^{x+y} \pmod{n}$. We can compute $a^{2^k} \pmod{n}$ in k multiplications by computing

$$\begin{aligned} & a^{2^0} \pmod{n} \\ & a^{2^1} \pmod{n} \\ & \vdots \\ & a^{2^k} \pmod{n}. \end{aligned}$$

Each step involves squaring the answer obtained in the previous step, dividing by n , and taking the remainder.

Example 4.4.1 Repeated Squares. We will compute $271^{321} \pmod{481}$. Notice that

$$321 = 2^0 + 2^6 + 2^8;$$

hence, computing $271^{321} \pmod{481}$ is the same as computing

$$271^{2^0+2^6+2^8} \equiv 271^{2^0} \cdot 271^{2^6} \cdot 271^{2^8} \pmod{481}.$$

So it will suffice to compute $271^{2^i} \pmod{481}$ where $i = 0, 6, 8$. It is very easy to see that

$$271^{2^1} = 73,441 \equiv 329 \pmod{481}.$$

We can square this result to obtain a value for $271^{2^2} \pmod{481}$:

$$\begin{aligned} 271^{2^2} &\equiv (271^{2^1})^2 \pmod{481} \\ &\equiv (329)^2 \pmod{481} \\ &\equiv 108,241 \pmod{481} \\ &\equiv 16 \pmod{481}. \end{aligned}$$

We are using the fact that $(a^{2^n})^2 \equiv a^{2^{n+1}} \pmod{n}$. Continuing, we can calculate

$$271^{2^6} \equiv 419 \pmod{481}$$

and

$$271^{2^8} \equiv 16 \pmod{481}.$$

Therefore,

$$\begin{aligned} 271^{321} &\equiv 271^{2^0+2^6+2^8} \pmod{481} \\ &\equiv 271^{2^0} \cdot 271^{2^6} \cdot 271^{2^8} \pmod{481} \\ &\equiv 271 \cdot 419 \cdot 16 \pmod{481} \\ &\equiv 1,816,784 \pmod{481} \\ &\equiv 47 \pmod{481}. \end{aligned}$$

□

¹The results in this section are needed only in [Chapter 2](#) (not really).

The method of repeated squares will prove to be a very useful tool when we explore RSA cryptography. To encode and decode messages in a reasonable manner under this scheme, it is necessary to be able to quickly compute large powers of integers mod n .

Remark 4.4.2 Sage. Sage support for cyclic groups is a little spotty — but we can still make effective use of Sage and perhaps this situation could change soon.

4.5 Exercises

1. Prove or disprove each of the following statements.

- (a) All of the generators of \mathbb{Z}_{60} are prime.
- (b) $U(8)$ is cyclic.
- (c) \mathbb{Q} is cyclic.
- (d) If every proper subgroup of a group G is cyclic, then G is a cyclic group.
- (e) A group with a finite number of subgroups is finite.

Hint. (a) False; (c) false; (e) true.

2. Find the order of each of the following elements.

- (a) $5 \in \mathbb{Z}_{12}$
- (b) $\sqrt{3} \in \mathbb{R}$
- (c) $\sqrt{3} \in \mathbb{R}^*$
- (d) $-i \in \mathbb{C}^*$
- (e) 72 in \mathbb{Z}_{240}
- (f) 312 in \mathbb{Z}_{471}

Hint. (a) 12; (c) infinite; (e) 10.

3. List all of the elements in each of the following subgroups.

- (a) The subgroup of \mathbb{Z} generated by 7
- (b) The subgroup of \mathbb{Z}_{24} generated by 15
- (c) All subgroups of \mathbb{Z}_{12}
- (d) All subgroups of \mathbb{Z}_{60}
- (e) All subgroups of \mathbb{Z}_{13}
- (f) All subgroups of \mathbb{Z}_{48}
- (g) The subgroup generated by 3 in $U(20)$
- (h) The subgroup generated by 5 in $U(18)$
- (i) The subgroup of \mathbb{R}^* generated by 7
- (j) The subgroup of \mathbb{C}^* generated by i where $i^2 = -1$
- (k) The subgroup of \mathbb{C}^* generated by $2i$
- (l) The subgroup of \mathbb{C}^* generated by $(1+i)/\sqrt{2}$

(m) The subgroup of \mathbb{C}^* generated by $(1 + \sqrt{3}i)/2$

Hint. (a) $7\mathbb{Z} = \{\dots, -7, 0, 7, 14, \dots\}$; (b) $\{0, 3, 6, 9, 12, 15, 18, 21\}$; (c) $\{0\}$, $\{0, 6\}$, $\{0, 4, 8\}$, $\{0, 3, 6, 9\}$, $\{0, 2, 4, 6, 8, 10\}$; (g) $\{1, 3, 7, 9\}$; (j) $\{1, -1, i, -i\}$.

4. Find the subgroups of $GL_2(\mathbb{R})$ generated by each of the following matrices.

$$\begin{array}{lll} \text{(a)} \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} & \text{(c)} \begin{pmatrix} 1 & -1 \\ 1 & 0 \end{pmatrix} & \text{(e)} \begin{pmatrix} 1 & -1 \\ -1 & 0 \end{pmatrix} \\ \text{(b)} \begin{pmatrix} 0 & 1/3 \\ 3 & 0 \end{pmatrix} & \text{(d)} \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix} & \text{(f)} \begin{pmatrix} \sqrt{3}/2 & 1/2 \\ -1/2 & \sqrt{3}/2 \end{pmatrix} \end{array}$$

Hint. (a)

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}.$$

(c)

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1 & -1 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} -1 & 1 \\ -1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ 1 & -1 \end{pmatrix}, \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}.$$

5. Find the order of every element in \mathbb{Z}_{18} .
6. Find the order of every element in the symmetry group of the square, D_4 .
7. What are all of the cyclic subgroups of the quaternion group, Q_8 ?
8. List all of the cyclic subgroups of $U(30)$.
9. List every generator of each subgroup of order 8 in \mathbb{Z}_{32} .
10. Find all elements of finite order in each of the following groups. Here the “*” indicates the set with zero removed.

$$\text{(a)} \mathbb{Z} \qquad \text{(b)} \mathbb{Q}^* \qquad \text{(c)} \mathbb{R}^*$$

Hint. (a) $0, 1, -1$; (b) $1, -1$

11. If $a^{24} = e$ in a group G , what are the possible orders of a ?

Hint. $1, 2, 3, 4, 6, 8, 12, 24$.

12. Find a cyclic group with exactly one generator. Can you find cyclic groups with exactly two generators? Four generators? How about n generators?
13. For $n \leq 20$, which groups $U(n)$ are cyclic? Make a conjecture as to what is true in general. Can you prove your conjecture?

14. Let

$$A = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 0 & -1 \\ 1 & -1 \end{pmatrix}$$

be elements in $GL_2(\mathbb{R})$. Show that A and B have finite orders but AB does not.

15. Evaluate each of the following.

$$\begin{array}{ll} \text{(a)} (3 - 2i) + (5i - 6) & \text{(d)} (9 - i)\overline{(9 - i)} \\ \text{(b)} (4 - 5i) - \overline{(4i - 4)} & \text{(e)} i^{45} \\ \text{(c)} (5 - 4i)(7 + 2i) & \text{(f)} (1 + i) + \overline{(1 + i)} \end{array}$$

Hint. (a) $-3 + 3i$; (c) $43 - 18i$; (e) i

16. Convert the following complex numbers to the form $a + bi$.

- (a) $2 \operatorname{cis}(\pi/6)$ (c) $3 \operatorname{cis}(\pi)$
 (b) $5 \operatorname{cis}(9\pi/4)$ (d) $\operatorname{cis}(7\pi/4)/2$

Hint. (a) $\sqrt{3} + i$; (c) -3 .

17. Change the following complex numbers to polar representation.

- (a) $1 - i$ (c) $2 + 2i$ (e) $-3i$
 (b) -5 (d) $\sqrt{3} + i$ (f) $2i + 2\sqrt{3}$

Hint. (a) $\sqrt{2} \operatorname{cis}(7\pi/4)$; (c) $2\sqrt{2} \operatorname{cis}(\pi/4)$; (e) $3 \operatorname{cis}(3\pi/2)$.

18. Calculate each of the following expressions.

- (a) $(1 + i)^{-1}$ (e) $((1 - i)/2)^4$
 (b) $(1 - i)^6$ (f) $(-\sqrt{2} - \sqrt{2}i)^{12}$
 (c) $(\sqrt{3} + i)^5$ (g) $(-2 + 2i)^{-5}$
 (d) $(-i)^{10}$

Hint. (a) $(1 - i)/2$; (c) $16(i - \sqrt{3})$; (e) $-1/4$.

19. Prove each of the following statements.

- (a) $|z| = |\bar{z}|$ (d) $|z + w| \leq |z| + |w|$
 (b) $z\bar{z} = |z|^2$ (e) $|z - w| \geq ||z| - |w||$
 (c) $z^{-1} = \bar{z}/|z|^2$ (f) $|zw| = |z||w|$

20. List and graph the 6th roots of unity. What are the generators of this group? What are the primitive 6th roots of unity?

21. List and graph the 5th roots of unity. What are the generators of this group? What are the primitive 5th roots of unity?

22. Calculate each of the following.

- (a) $292^{3171} \pmod{582}$ (c) $2071^{9521} \pmod{4724}$
 (b) $2557^{341} \pmod{5681}$ (d) $971^{321} \pmod{765}$

Hint. (a) 292; (c) 1523.

23. Let $a, b \in G$. Prove the following statements.

- (a) The order of a is the same as the order of a^{-1} .
 (b) For all $g \in G$, $|a| = |g^{-1}ag|$.
 (c) The order of ab is the same as the order of ba .

24. Let p and q be distinct primes. How many generators does \mathbb{Z}_{pq} have?

25. Let p be prime and r be a positive integer. How many generators does \mathbb{Z}_{p^r} have?

26. Prove that \mathbb{Z}_p has no nontrivial subgroups if p is prime.
27. If g and h have orders 15 and 16 respectively in a group G , what is the order of $\langle g \rangle \cap \langle h \rangle$?
Hint. $|\langle g \rangle \cap \langle h \rangle| = 1$.
28. Let a be an element in a group G . What is a generator for the subgroup $\langle a^m \rangle \cap \langle a^n \rangle$?
29. Prove that \mathbb{Z}_n has an even number of generators for $n > 2$.
30. Suppose that G is a group and let $a, b \in G$. Prove that if $|a| = m$ and $|b| = n$ with $\gcd(m, n) = 1$, then $\langle a \rangle \cap \langle b \rangle = \{e\}$.
31. Let G be an abelian group. Show that the elements of finite order in G form a subgroup. This subgroup is called the **torsion subgroup** of G .
Hint. The identity element in any group has finite order. Let $g, h \in G$ have orders m and n , respectively. Since $(g^{-1})^m = e$ and $(gh)^{mn} = e$, the elements of finite order in G form a subgroup of G .
32. Let G be a finite cyclic group of order n generated by x . Show that if $y = x^k$ where $\gcd(k, n) = 1$, then y must be a generator of G .
33. If G is an abelian group that contains a pair of cyclic subgroups of order 2, show that G must contain a subgroup of order 4. Does this subgroup have to be cyclic?
34. Let G be an abelian group of order pq where $\gcd(p, q) = 1$. If G contains elements a and b of order p and q respectively, then show that G is cyclic.
35. Prove that the subgroups of \mathbb{Z} are exactly $n\mathbb{Z}$ for $n = 0, 1, 2, \dots$
36. Prove that the generators of \mathbb{Z}_n are the integers r such that $1 \leq r < n$ and $\gcd(r, n) = 1$.
37. Prove that if G has no proper nontrivial subgroups, then G is a cyclic group.
Hint. If g is an element distinct from the identity in G , g must generate G ; otherwise, $\langle g \rangle$ is a nontrivial proper subgroup of G .
38. Prove that the order of an element in a cyclic group G must divide the order of the group.
39. Prove that if G is a cyclic group of order m and $d \mid m$, then G must have a subgroup of order d .
40. For what integers n is -1 an n th root of unity?
41. If $z = r(\cos \theta + i \sin \theta)$ and $w = s(\cos \phi + i \sin \phi)$ are two nonzero complex numbers, show that
- $$zw = rs[\cos(\theta + \phi) + i \sin(\theta + \phi)].$$
42. Prove that the circle group is a subgroup of \mathbb{C}^* .
43. Prove that the n th roots of unity form a cyclic subgroup of \mathbb{T} of order n .
44. Let $\alpha \in \mathbb{T}$. Prove that $\alpha^m = 1$ and $\alpha^n = 1$ if and only if $\alpha^d = 1$ for $d = \gcd(m, n)$.
45. Let $z \in \mathbb{C}^*$. If $|z| \neq 1$, prove that the order of z is infinite.
46. Let $z = \cos \theta + i \sin \theta$ be in \mathbb{T} where $\theta \in \mathbb{Q}$. Prove that the order of z is infinite.

4.6 Programming Exercises

1. Write a computer program that will write any decimal number as the sum of distinct powers of 2. What is the largest integer that your program will handle?
2. Write a computer program to calculate $a^x \pmod{n}$ by the method of repeated squares. What are the largest values of n and x that your program will accept?

4.7 Sage Exercises

This group of exercises is about the group of units mod n , $U(n)$, which is sometimes cyclic, sometimes not. There are some commands in Sage that will answer some of these questions very quickly, but instead of using those now, just use the basic techniques described. The idea here is to just work with elements, and lists of elements, to discern the subgroup structure of these groups.

1. Execute the statement `R = Integers(40)` to create the set $[0, 1, 2, \dots, 39]$. This is a group under addition mod 40, which we will ignore. Instead we are interested in the subset of elements which have an inverse under *multiplication* mod 40. Determine how big this subgroup is by executing the command `R.unit_group_order()`, and then obtain a list of these elements with `R.list_of_elements_of_multiplicative_group()`.
2. You can create elements of this group by coercing regular integers into U , such as with the statement `a = U(7)`. (Don't confuse this with our mathematical notation $U(40)$.) This will tell Sage that you want to view 7 as an element of U , subject to the corresponding operations. Determine the elements of the cyclic subgroup of U generated by 7 with a list comprehension as follows:

```
R = Integers(40)
a = R(7)
[a^i for i in xrange(16)]
```

What is the order of 7 in $U(40)$?

3. The group $U(49)$ is cyclic. Using only the Sage commands described previously, use Sage to find a generator for this group. Now using *only* theorems about the structure of cyclic groups, describe each of the subgroups of $U(49)$ by specifying its order and by giving an explicit generator. Do not repeat any of the subgroups — in other words, present each subgroup *exactly* once. You can use Sage to check your work on the subgroups, but your answer about the subgroups should rely only on theorems and be a nicely written paragraph with a table, etc.
4. The group $U(35)$ is not cyclic. Again, using only the Sage commands described previously, use computations to provide irrefutable evidence of this. How many of the 16 different subgroups of $U(35)$ can you list?
5. Again, using only the Sage commands described previously, explore the structure of $U(n)$ for various values of n and see if you can formulate an interesting conjecture about some basic property of this group. (Yes, this is a *very* open-ended question, but this is ultimately the real power of exploring mathematics with Sage.)

Notation

The following table defines the notation used in this book. Page numbers or references refer to the first appearance of each symbol.

Symbol	Description	Page
$a \in A$	a is in the set A	3
\mathbb{N}	the natural numbers	4
\mathbb{Z}	the integers	4
\mathbb{Q}	the rational numbers	4
\mathbb{R}	the real numbers	4
\mathbb{C}	the complex numbers	4
$A \subset B$	A is a subset of B	4
\emptyset	the empty set	4
$A \cup B$	the union of sets A and B	4
$A \cap B$	the intersection of sets A and B	4
A'	complement of the set A	5
$A \setminus B$	difference between sets A and B	5
$A \times B$	Cartesian product of sets A and B	6
A^n	$A \times \cdots \times A$ (n times)	7
id	identity mapping	10
f^{-1}	inverse of the function f	10
$a \equiv b \pmod{n}$	a is congruent to b modulo n	13
$n!$	n factorial	24
$\binom{n}{k}$	binomial coefficient $n!/(k!(n-k)!)$	24
$a \mid b$	a divides b	26
$\gcd(a, b)$	greatest common divisor of a and b	26
$\mathcal{P}(X)$	power set of X	34
$\text{lcm}(m, n)$	the least common multiple of m and n	36
\mathbb{Z}_n	the integers modulo n	38
$U(n)$	group of units in \mathbb{Z}_n	44
$M_n(\mathbb{R})$	the $n \times n$ matrices with entries in \mathbb{R}	44
$\det A$	the determinant of A	44
$GL_n(\mathbb{R})$	the general linear group	44
Q_8	the group of quaternions	45
\mathbb{C}^*	the multiplicative group of complex numbers	45
$ G $	the order of a group	45
\mathbb{R}^*	the multiplicative group of real numbers	47
\mathbb{Q}^*	the multiplicative group of rational numbers	47
$SL_n(\mathbb{R})$	the special linear group	48

(Continued on next page)

Symbol	Description	Page
$Z(G)$	the center of a group	59
$\langle a \rangle$	cyclic group generated by a	63
$ a $	the order of an element a	64
$\operatorname{cis} \theta$	$\cos \theta + i \sin \theta$	67
\mathbb{T}	the circle group	69

Appendix B

Hints and Solutions to Selected Exercises

1 · Preliminaries

1.4 · Exercises

1.4.1. Hint. (a) $A \cap B = \{2\}$; (b) $B \cap C = \{5\}$.

1.4.2. Hint. (a) $A \times B = \{(a, 1), (a, 2), (a, 3), (b, 1), (b, 2), (b, 3), (c, 1), (c, 2), (c, 3)\}$;
(d) $A \times D = \emptyset$.

1.4.6. Hint. If $x \in A \cup (B \cap C)$, then either $x \in A$ or $x \in B \cap C$. Thus, $x \in A \cup B$ and $A \cup C$. Hence, $x \in (A \cup B) \cap (A \cup C)$. Therefore, $A \cup (B \cap C) \subset (A \cup B) \cap (A \cup C)$. Conversely, if $x \in (A \cup B) \cap (A \cup C)$, then $x \in A \cup B$ and $A \cup C$. Thus, $x \in A$ or x is in both B and C . So $x \in A \cup (B \cap C)$ and therefore $(A \cup B) \cap (A \cup C) \subset A \cup (B \cap C)$. Hence, $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$.

1.4.10. Hint. $(A \cap B) \cup (A \setminus B) \cup (B \setminus A) = (A \cap B) \cup (A \cap B') \cup (B \cap A') = [A \cap (B \cup B')] \cup (B \cap A') = A \cup (B \cap A') = (A \cup B) \cap (A \cup A') = A \cup B$.

1.4.14. Hint. $A \setminus (B \cup C) = A \cap (B \cup C)' = (A \cap A) \cap (B' \cap C') = (A \cap B') \cap (A \cap C') = (A \setminus B) \cap (A \setminus C)$.

1.4.17. Hint. (a) Not a map since $f(2/3)$ is undefined; (b) this is a map; (c) not a map, since $f(1/2) = 3/4$ but $f(2/4) = 3/8$; (d) this is a map.

1.4.18. Hint. (a) f is one-to-one but not onto. $f(\mathbb{R}) = \{x \in \mathbb{R} : x > 0\}$. (c) f is neither one-to-one nor onto. $f(\mathbb{R}) = \{x : -1 \leq x \leq 1\}$.

1.4.20. Hint. (a) $f(n) = n + 1$.

1.4.22. Hint. (a) Let $x, y \in A$. Then $g(f(x)) = (g \circ f)(x) = (g \circ f)(y) = g(f(y))$. Thus, $f(x) = f(y)$ and $x = y$, so $g \circ f$ is one-to-one. (b) Let $c \in C$, then $c = (g \circ f)(x) = g(f(x))$ for some $x \in A$. Since $f(x) \in B$, g is onto.

1.4.23. Hint. $f^{-1}(x) = (x + 1)/(x - 1)$.

1.4.24. Hint. (a) Let $y \in f(A_1 \cup A_2)$. Then there exists an $x \in A_1 \cup A_2$ such that $f(x) = y$. Hence, $y \in f(A_1)$ or $f(A_2)$. Therefore, $y \in f(A_1) \cup f(A_2)$. Consequently, $f(A_1 \cup A_2) \subset f(A_1) \cup f(A_2)$. Conversely, if $y \in f(A_1) \cup f(A_2)$, then $y \in f(A_1)$ or $f(A_2)$. Hence, there exists an $x \in A_1$ or there exists an $x \in A_2$ such that $f(x) = y$. Thus, there exists an $x \in A_1 \cup A_2$ such that $f(x) = y$. Therefore, $f(A_1) \cup f(A_2) \subset f(A_1 \cup A_2)$, and $f(A_1 \cup A_2) = f(A_1) \cup f(A_2)$.

1.4.25. Hint. (a) The relation fails to be symmetric. (b) The relation is not reflexive, since 0 is not equivalent to itself. (c) The relation is not transitive.

1.4.28. Hint. Let $X = \mathbb{N} \cup \{\sqrt{2}\}$ and define $x \sim y$ if $x + y \in \mathbb{N}$.

2 · The Integers

2.4 · Exercises

2.4.1. Answer. The base case, $S(1) : [1(1+1)(2(1)+1)]/6 = 1 = 1^2$ is true. Assume that $S(k) : 1^2 + 2^2 + \dots + k^2 = [k(k+1)(2k+1)]/6$ is true. Then

$$\begin{aligned} 1^2 + 2^2 + \dots + k^2 + (k+1)^2 &= [k(k+1)(2k+1)]/6 + (k+1)^2 \\ &= [(k+1)((k+1)+1)(2(k+1)+1)]/6, \end{aligned}$$

and so $S(k+1)$ is true. Thus, $S(n)$ is true for all positive integers n .

2.4.3. Answer. The base case, $S(4) : 4! = 24 > 16 = 2^4$ is true. Assume $S(k) : k! > 2^k$ is true. Then $(k+1)! = k!(k+1) > 2^k \cdot 2 = 2^{k+1}$, so $S(k+1)$ is true. Thus, $S(n)$ is true for all positive integers n .

2.4.8. Hint. Follow the proof in [Example 2.1.4](#).

2.4.11. Hint. The base case, $S(0) : (1+x)^0 - 1 = 0 \geq 0 = 0 \cdot x$ is true. Assume $S(k) : (1+x)^k - 1 \geq kx$ is true. Then

$$\begin{aligned} (1+x)^{k+1} - 1 &= (1+x)(1+x)^k - 1 \\ &= (1+x)^k + x(1+x)^k - 1 \\ &\geq kx + x(1+x)^k \\ &\geq kx + x \\ &= (k+1)x, \end{aligned}$$

so $S(k+1)$ is true. Therefore, $S(n)$ is true for all positive integers n .

2.4.17. Fibonacci Numbers. Hint. For [Item 2.4.17.a](#) and [Item 2.4.17.b](#) use mathematical induction. [Item 2.4.17.c](#) Show that $f_1 = 1$, $f_2 = 1$, and $f_{n+2} = f_{n+1} + f_n$. [Item 2.4.17.d](#) Use part [Item 2.4.17.c](#). [Item 2.4.17.e](#) Use part [Item 2.4.17.b](#) and [Exercise 2.4.16](#).

2.4.19. Hint. Use the Fundamental Theorem of Arithmetic.

2.4.23. Hint. Let $S = \{s \in \mathbb{N} : a \mid s, b \mid s\}$. Then $S \neq \emptyset$, since $|ab| \in S$. By the Principle of Well-Ordering, S contains a least element m . To show uniqueness, suppose that $a \mid n$ and $b \mid n$ for some $n \in \mathbb{N}$. By the division algorithm, there exist unique integers q and r such that $n = mq + r$, where $0 \leq r < m$. Since a and b divide both m , and n , it must be the case that a and b both divide r . Thus, $r = 0$ by the minimality of m . Therefore, $m \mid n$.

2.4.27. Hint. Since $\gcd(a, b) = 1$, there exist integers r and s such that $ar + bs = 1$. Thus, $acr + bcs = c$. Since a divides both bc and itself, a must divide c .

2.4.29. Hint. Every prime must be of the form $2, 3, 6n + 1$, or $6n + 5$. Suppose there are only finitely many primes of the form $6k + 5$.

3 · Groups

3.5 · Exercises

3.5.1. Hint. (a) $3 + 7\mathbb{Z} = \{\dots, -4, 3, 10, \dots\}$; (c) $18 + 26\mathbb{Z}$; (e) $5 + 6\mathbb{Z}$.

3.5.2. Hint. (a) Not a group; (c) a group.

3.5.6. Hint.

·	1	5	7	11
1	1	5	7	11
5	5	1	11	7
7	7	11	1	5
11	11	7	5	1

3.5.8. Hint. Pick two matrices. Almost any pair will work.

3.5.15. Hint. There is a nonabelian group containing six elements.

3.5.16. Hint. Look at the symmetry group of an equilateral triangle or a square.

3.5.17. Hint. There are five different groups of order 8.

3.5.18. Hint. Let

$$\sigma = \begin{pmatrix} 1 & 2 & \cdots & n \\ a_1 & a_2 & \cdots & a_n \end{pmatrix}$$

be in S_n . All of the a_i s must be distinct. There are n ways to choose a_1 , $n-1$ ways to choose a_2, \dots , 2 ways to choose a_{n-1} , and only one way to choose a_n . Therefore, we can form σ in $n(n-1)\cdots 2 \cdot 1 = n!$ ways.

3.5.25. Hint.

$$\begin{aligned} (aba^{-1})^n &= (aba^{-1})(aba^{-1})\cdots(aba^{-1}) \\ &= ab(aa^{-1})b(aa^{-1})b\cdots b(aa^{-1})ba^{-1} \\ &= ab^n a^{-1}. \end{aligned}$$

3.5.31. Hint. Since $abab = (ab)^2 = e = a^2b^2 = aabb$, we know that $ba = ab$.

3.5.35. Hint. $H_1 = \{id\}$, $H_2 = \{id, \rho_1, \rho_2\}$, $H_3 = \{id, \mu_1\}$, $H_4 = \{id, \mu_2\}$, $H_5 = \{id, \mu_3\}$, S_3 .

3.5.41. Hint. The identity of G is $1 = 1 + 0\sqrt{2}$. Since $(a + b\sqrt{2})(c + d\sqrt{2}) = (ac + 2bd) + (ad + bc)\sqrt{2}$, G is closed under multiplication. Finally, $(a + b\sqrt{2})^{-1} = a/(a^2 - 2b^2) - b\sqrt{2}/(a^2 - 2b^2)$.

3.5.46. Hint. Look at S_3 .

3.5.49. Hint. Since $a^4b = ba$, it must be the case that $b = a^6b = a^2ba$, and we can conclude that $ab = a^3ba = ba$.

4 · Cyclic Groups

4.5 · Exercises

4.5.1. Hint. (a) False; (c) false; (e) true.

4.5.2. Hint. (a) 12; (c) infinite; (e) 10.

4.5.3. Hint. (a) $7\mathbb{Z} = \{\dots, -7, 0, 7, 14, \dots\}$; (b) $\{0, 3, 6, 9, 12, 15, 18, 21\}$; (c) $\{0\}$, $\{0, 6\}$, $\{0, 4, 8\}$, $\{0, 3, 6, 9\}$, $\{0, 2, 4, 6, 8, 10\}$; (g) $\{1, 3, 7, 9\}$; (j) $\{1, -1, i, -i\}$.

4.5.4. Hint. (a)

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}.$$

(c)

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1 & -1 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} -1 & 1 \\ -1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ 1 & -1 \end{pmatrix}, \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}.$$

4.5.10. Hint. (a) 0, 1, -1; (b) 1, -1**4.5.11. Hint.** 1, 2, 3, 4, 6, 8, 12, 24.**4.5.15. Hint.** (a) $-3 + 3i$; (c) $43 - 18i$; (e) i **4.5.16. Hint.** (a) $\sqrt{3} + i$; (c) -3 .**4.5.17. Hint.** (a) $\sqrt{2} \operatorname{cis}(7\pi/4)$; (c) $2\sqrt{2} \operatorname{cis}(\pi/4)$; (e) $3 \operatorname{cis}(3\pi/2)$.**4.5.18. Hint.** (a) $(1 - i)/2$; (c) $16(i - \sqrt{3})$; (e) $-1/4$.**4.5.22. Hint.** (a) 292; (c) 1523.**4.5.27. Hint.** $|\langle g \rangle \cap \langle h \rangle| = 1$.**4.5.31. Hint.** The identity element in any group has finite order. Let $g, h \in G$ have orders m and n , respectively. Since $(g^{-1})^m = e$ and $(gh)^{mn} = e$, the elements of finite order in G form a subgroup of G .**4.5.37. Hint.** If g is an element distinct from the identity in G , g must generate G ; otherwise, $\langle g \rangle$ is a nontrivial proper subgroup of G .

Inside a subsection.

C.1.1.1 A Subsubsection in a Subsection in a Section in an Appendix

Nearly terminal.

Paragraphs in a Subsubsection in a Subsection in a Section in an Appendix. The paragraphs element can go in any division, but does not get a number.

Appendix D

GNU Free Documentation License

Version 1.3, 3 November 2008

Copyright © 2000, 2001, 2002, 2007, 2008 Free Software Foundation, Inc.
<<http://www.fsf.org/>>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

0. PREAMBLE. The purpose of this License is to make a manual, textbook, or other functional and useful document “free” in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of “copyleft”, which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

1. APPLICABILITY AND DEFINITIONS. This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The “Document”, below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as “you”. You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A “Modified Version” of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A “Secondary Section” is a named appendix or a front-matter section of

the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

The "publisher" means any person or entity that distributes copies of the Document to the public.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards

disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

2. VERBATIM COPYING. You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3. COPYING IN QUANTITY. If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS. You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You

may use the same title as a previous version if the original publisher of that version gives permission.

- B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
- C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
- D. Preserve all the copyright notices of the Document.
- E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
- G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
- H. Include an unaltered copy of this License.
- I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
- J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
- K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
- L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
- M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
- N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
- O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties — for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS. You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

6. COLLECTIONS OF DOCUMENTS. You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS. A compilation of the Document or its derivatives with other separate and independent

documents or works, in or on a volume of a storage or distribution medium, is called an “aggregate” if the copyright resulting from the compilation is not used to limit the legal rights of the compilation’s users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document’s Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

8. TRANSLATION. Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled “Acknowledgements”, “Dedications”, or “History”, the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

9. TERMINATION. You may not copy, modify, sublicense, or distribute the Document except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, or distribute it is void, and will automatically terminate your rights under this License.

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, receipt of a copy of some or all of the same material does not give you any rights to use it.

10. FUTURE REVISIONS OF THIS LICENSE. The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License “or

any later version” applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy’s public statement of acceptance of a version permanently authorizes you to choose that version for the Document.

11. RELICENSING. “Massive Multiauthor Collaboration Site” (or “MMC Site”) means any World Wide Web server that publishes copyrightable works and also provides prominent facilities for anybody to edit those works. A public wiki that anybody can edit is an example of such a server. A “Massive Multiauthor Collaboration” (or “MMC”) contained in the site means any set of copyrightable works thus published on the MMC site.

“CC-BY-SA” means the Creative Commons Attribution-Share Alike 3.0 license published by Creative Commons Corporation, a not-for-profit corporation with a principal place of business in San Francisco, California, as well as future copyleft versions of that license published by that same organization.

“Incorporate” means to publish or republish a Document, in whole or in part, as part of another Document.

An MMC is “eligible for relicensing” if it is licensed under this License, and if all works that were first published under this License somewhere other than this MMC, and subsequently incorporated in whole or in part into the MMC, (1) had no cover texts or invariant sections, and (2) were thus incorporated prior to November 1, 2008.

The operator of an MMC Site may republish an MMC contained in the site under CC-BY-SA on the same site at any time before August 1, 2009, provided the MMC is eligible for relicensing.

ADDENDUM: How to use this License for your documents. To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright (C) YEAR YOUR NAME.

Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.3 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled “GNU Free Documentation License”.

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the “with... Texts.” line with this:

with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
